Network Mobility (NEMO) Management Information Base

Status of This Memo

Copyright Notice

Abstract

This memo defines a portion of the Management Information Base (MIB), the Network Mobility (NEMO) support MIB, for use with network management protocols in the Internet community. In particular, the NEMO MIB will be used to monitor and control a Mobile IPv6 node with NEMO functionality.

Table of Contents

1. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC 3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIv2, which is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] and STD 58, RFC 2580 [RFC2580].

2. Overview

2.1. The Mobile IPv6 Protocol and NEMO Entities

Mobile IPv6 (MIPv6) [RFC3775] specifies a protocol that allows nodes to remain reachable while moving around in the IPv6 Internet. The Network Mobility (NEMO) Basic Support Protocol [RFC3963] is an extension to the Mobile IPv6 protocol that facilitates the movement of an entire network. The goals of Network Mobility support and related terminology are discussed in [RFC4886] and [RFC4885], respectively.

Typically, mobile routers implement NEMO functionality for achieving network mobility. However, a mobile router may also function as a mobile node. In the context of this document, an entity that implements the NEMO protocol is a NEMO entity.

This document defines a set of managed objects (MOs) that can be used to monitor and control NEMO entities.

2.2. Relationship to Other MIB Modules

This document focuses on the management of a NEMO entity. It is assumed that implementations will support the ifTable from the IF-MIB [RFC2863]. The MOBILEIPV6-MIB [RFC4295] defines the managed objects for a mobile node. Implementations supporting both the mobile node and NEMO functionality SHOULD implement the managed objects defined for the NEMO entities and mobile nodes from both the MOBILEIPV6-MIB and NEMO-MIB. The NEMO-MIB uses the textual conventions defined in the INET-ADDRESS-MIB [RFC4001].

2.3. Terminology

The terminology used in this document is consistent with the definitions used in the Mobile IPv6 protocol specification [RFC3775] and the NEMO Basic Support specification [RFC3963].

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14, RFC 2119 [RFC2119].

2.4. MIB Design

The NEMO MIB comprises the following groups of definitions:

nemoCore: a generic group containing objects that are common to all NEMO entities.

nemoHa: this group models the home agent service. It is composed of objects specific to the services and associated advertisement parameters offered by the home agent on each of its links. It also contains objects pertaining to the maintenance of the home agent list on each of the links on which the service is offered.

nemoMr: this group models the mobile router service. It is composed of objects specific to the Dynamic Home Agent discovery function and related parameters. It also contains objects that record the movement of the mobile router.

nemoNotifications: defines the set of notifications that will be used to asynchronously monitor the NEMO entities.

The tables contained in the above groups are as follows:

nemoBindingCacheTable: models the Binding Cache on the home agent and correspondent node. It contains details of the Binding Update requests that have been received and accepted.

nemoMrEgressIfTable: contains information on the configured egress interfaces.

nemoMrBLTable: models the Binding Update List on the mobile router. It contains information about the registration requests sent by the mobile router and the corresponding results.

nemoHaCounterTable: contains registration statistics for all mobile routers registered with the home agent.

nemoHaMobileNetworkPrefixTable: contains the list of the mobile network prefixes that are maintained by the home agent.

3. The NEMO MIB

          ::= { nemoSystem 1 }

       nemoStatus OBJECT-TYPE
          SYNTAX      INTEGER { enabled(1), disabled(2) }
          MAX-ACCESS  read-write
          STATUS      current
          DESCRIPTION
                  "This object indicates whether the NEMO
                   function is enabled for the managed entity.  If it
                   is enabled, the agent discovery and registration
                   functions will be operational.

                   Changing the status from enabled(1) to disabled(2)
                   will terminate the agent discovery and registration
                   functions.  On the other hand, changing the status
                   from disabled(2) to enabled(1) will start the agent
                   discovery and registration functions.

                   The value of this object MUST remain unchanged
                   across reboots of the managed entity.

        ::= { nemoHaRegistration 1 }

    nemoHaMobileNetworkPrefixEntry OBJECT-TYPE
        SYNTAX      NemoHaMobileNetworkPrefixEntry
        MAX-ACCESS  not-accessible
        STATUS      current
        DESCRIPTION
                "An entry for a mobile network prefix.

                 The instances of the columnar objects in this entry
                 pertain to an interface for a particular value of
                 mip6BindingHomeAddressType, mip6BindingHomeAddress,
                 and nemoHaMobileNetworkPrefixSeqNo.

                 The nemoHaMobileNetworkPrefixSeqNo object is used to
                 distinguish between multiple instances of
                 the mobile network prefix in the same Binding Update
                 for the same set of mip6BindingHomeAddressType and
                 mip6BindingHomeAddress.

                 There is no upper-bound on the maximum number of
                 mobile network prefixes in a Binding Update but, for
                 practical purposes, the upper bound of the value
```

```
                nemoHaMobileNetworkPrefixSeqNo is set to 1024.

                Implementers need to be aware that if the total
                number of octets in mip6BindingHomeAddress
                exceeds 112, then OIDs of column
                instances in this row will have more than 128
                sub-identifiers and cannot be accessed using
                SNMPv1, SNMPv2c, or SNMPv3.

                movement to/from a foreign network from/to another
                foreign network.  Note that 'movement' implies
                movement in layer 3, i.e., the mobile router's care-of
                address changed, and it initiated the care-of address
                registration process.

                If there are multiple egress interfaces, this counter
                counts the total number of movements.  The movement
                as a mobile node of the mobile entity is not counted.

                Discontinuities in the value of this counter can
                occur at re-initialization of the management system,
                and at other times as indicated by the value of
                nemoCounterDiscontinuityTime.

4. IANA Considerations

IANA has assigned a base arc in the mib-2 (Standards Track) OID tree for the 'nemoMIB' (184).

5. Security Considerations

There are a number of management objects defined in this MIB module with a MAX-ACCESS clause of read-write. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations. These are the tables and objects and their sensitivity/vulnerability:

nemoStatus: The value of this object is used to enable or disable the NEMO functionality on a NEMO entity. Access to this MO may be abused to disrupt the communication that depends on NEMO.

nemoMrPrefixRegMode: The value of this object is used to control the mode in which mobile network prefixes will be registered with the home agent. Access to this object may be abused to disrupt the setting up of mobile network prefixes.

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET and/or NOTIFY access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP. These are the tables and objects and their sensitivity/vulnerability:

nemoHaMobileNetworkPrefixType

nemoHaMobileNetworkPrefix

nemoHaMobileNetworkPrefixLength:

The above address-related objects may be considered to be particularly sensitive and/or private. The mobile-network-prefix-related objects reveal the configuration of the mobile router and, as such, may be considered to be sensitive.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPsec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is RECOMMENDED that implementers consider the security features as provided by the SNMPv3 framework (see [RFC3410], section 8), including full support for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

6. Acknowledgments

The authors would like to thank Alex Petrescu, Pascal Thubert, Kent Leung, T.J Kniveton, Thierry Ernst, Alberto Garcia, Marcelo Bagnulo, Vijay K. Gurbani, Bert Wijnen, Chris Newman, Dan Romanascu, and Jari Arkko for their review comments on this document.
