

Definitions of Managed Objects  
for SMDS Interfaces using SMIV2

Status of this Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in TCP/IP-based internets. In particular, it defines objects for managing objects for SMDS access interfaces. This includes the following access protocols:

SIP [13]  
SIP/DXI [18] and [20]  
SIP/FR [19]  
SIP/ATM [24]

This memo replaces RFC 1304 [12], and defines a MIB module which is both compliant to the SNMPv2 SMI and semantically-identical to the existing RFC 1304-based definitions.

This memo also assumes application of the MIB II Interfaces group as defined in [9].

## 1. The SNMPv2 Network Management Framework

The SNMPv2 Network Management Framework consists of four major components. They are:

- o RFC 1442 [1] which defines the SMI, the mechanisms used for describing and naming objects for the purpose of management.
- o STD 17, RFC 1213 [6] defines MIB-II, the core set of managed objects for the Internet suite of protocols. Reference [12] defines the evolution of the Interfaces Group of MIB II in terms of extensions and precise applications of the objects.
- o RFC 1445 [4] which defines the administrative and other architectural aspects of the framework.
- o RFC 1448 [5] which defines the protocol used for network access to managed objects.

The Framework permits new objects to be defined for the purpose of experimentation and evaluation.

This specification makes also use of:

- o RFC 1443 [2] which defines textual conventions for the specification of managed objects.
- o RFC 1444 [3] which defines conformance statements for the specification of managed objects.

## 2. Objects

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. Objects in the MIB are defined using the subset of Abstract Syntax Notation One (ASN.1) [7] defined in the SMI. In particular, each object has a name, a syntax, and an encoding. The name is an object identifier, an administratively assigned name, which specifies an object type. The object type together with an object instance serves to uniquely identify a specific instantiation of the object. For human convenience, we often use a textual string, termed the OBJECT DESCRIPTOR, to also refer to the object type.

The syntax of an object type defines the abstract data structure corresponding to that object type. The ASN.1 language is used for this purpose. However, the SMI RFC 1442 purposely restricts the ASN.1 constructs which may be used. These restrictions are explicitly made for simplicity.

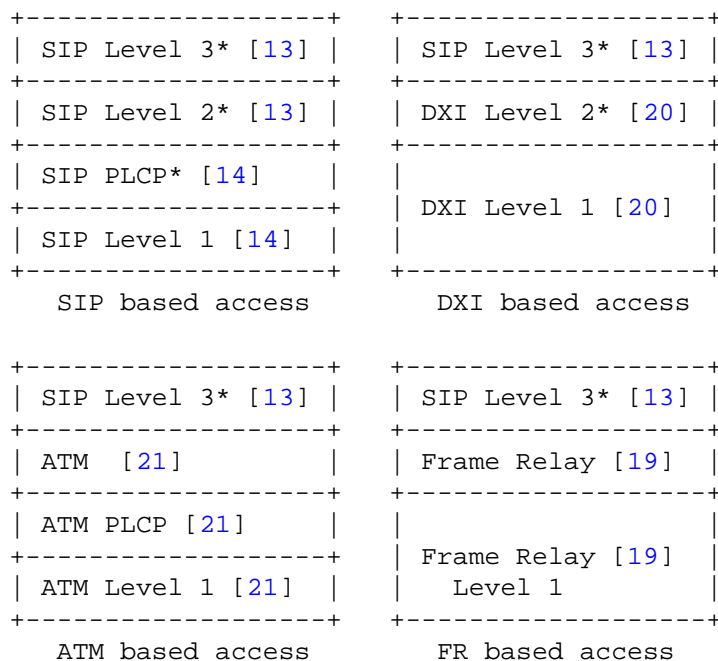

The encoding of an object type is simply how that object type is represented using the object type's syntax. Implicitly tied to the notion of an object type's syntax and encoding is how the object type is represented when being transmitted on the network. The SMI specifies the use of the basic encoding rules of ASN.1 [8], subject to the additional requirements imposed by the SNMP.

### 2.1. Format of Definitions

Section 4 contains the specification of all object types contained in this MIB module. The object types are defined using the conventions defined in the SMI, as amended by the extensions specified in the SNMPv2 SMI.

### 3. Overview

SMDS is a service that can be provided by numerous interface protocols as shown in the following figure:

In the figure below, managed objects for the protocol levels marked with a (\*) are defined in this memo. Additional managed objects that must be used to manage SMDS interfaces are defined in other MIB modules as indicated in the figure.

+-----+	+-----+
SIP Level 3*	SIP Level 3*
+-----+	+-----+
SIP Level 2*	DXI Level 2*
+-----+	+-----+
SIP PLCP*	
+-----+	+-----+
SIP Level 1	DXI Level 1
[10] or [11]	[10]
+-----+	+-----+
SIP based access	DXI based access
+-----+	+-----+
SIP Level 3*	SIP Level 3*
+-----+	+-----+
ATM [22]	Frame Relay [23]
+-----+	+-----+
ATM PLCP/TC [22]	
+-----+	+-----+
ATM Level 1 [10]	Frame Relay
[11], or [25]	Level 1
+-----+	[10] or [11]
+-----+	+-----+
ATM based access	FR based access

With the improved interpretation of the MIB II interfaces group [9], some objects can be represented by ifTable. This means that these objects have been deprecated from the MIB module defined in RFC 1304, and ifTable is used instead. No semantical changes have been made to these objects. Only the object identifiers and object descriptors have been changed to the objects defined in ifTable.

Implementation experience has shown that the objects sipL3UnrecognizedIndividualDAs and sipL3UnrecognizedGAs were not supported.

### 3.1. SIP Level 3

Objects for SIP Level 3 apply to all methods to access SMDS shown in the figures above. With the improved interpretation of the MIB II interfaces group, most objects can be represented by ifTable. The appropriate mapping is defined below.

This document does not specify objects for the management of subscription or configuration of Subscriber-Network Interfaces (SNIs). Those objects are defined in Definitions of Managed Objects for SMDS Subscription [17]. Bellcore requirements on these objects are specified in TR-TSV-001062 [16].

ifTable Object	Use for
=====	=====
ifIndex	Interface index.
ifDescr	Interface description. For example, SIP Level 3 sublayer of a SNI.
ifType	Set to 31.
ifMtu	Set to 9232.
ifSpeed	Peak bandwidth in bits per second available for use as provided by the supporting Level 2 protocol. For example, 1.17 Mbps when using SIP based DS1 SNIs, and 1.536 Mbps when using DXI-based DS1 DXI-SNI.
ifPhysAddress	OCTET STRING of Size 8. Value is a 16-digit Binary Coded Decimal SMDS address that is assigned to this interface.
ifAdminStatus	The desired administrative status of the SMDS interface.
ifOperStatus	The current operational status of the SMDS interface.
ifLastChange	The elapsed time since the last re-initialization of the interface. The value of sysUpTime at the time the interface entered its current operational state. If the current state was entered prior to the last re-initialization of the local network management subsystem, then this object contains a zero value.
ifInOctets	Number of received octets at SIP Level 3. For SIP based SNIs, this is the number of sipL2ReceivedCounts multiplied by 44.

ifInUcastPkts	The total number of individually addressed SIP Level 3 PDUs received from the remote system across the SNI. The total includes only unerrored SIP Level 3 PDUs. [identical to <a href="#">RFC1304</a> : sipL3ReceivedIndividualDAs]
ifInDiscards	The number of received SIP Level 3 PDUs discarded. For SMDS interfaces, this counter will always be zero.
ifInErrors	The total number of SIP Level 3 PDUs received from the remote system that were discovered to have errors (including protocol processing and bit errors but excluding addressing-related errors) and were discarded. Includes both group addressed SIP Level 3 PDUs and SIP Level 3 PDUs containing an individual destination address. [identical to <a href="#">RFC1304</a> : sipL3Errors]
ifInUnknownProtos	The number of SIP Level 3 PDUs received from the remote system with a Source or Destination Address_Type subfields, (the four most significant bits of the 64 bit address field), not equal to the value 1100 or 1110. Also, an error is considered to have occurred if the Address_Type field for a Source Address is equal to 1110 (a group address). [identical to <a href="#">RFC1304</a> : sipL3InvalidSMDSAddressTypes]
ifOutOctets	Number of received octets for transmission at SIP Level 3. For SIP based SNIs, this is the number of sipL2SentCounts multiplied by 44.
ifOutUcastPkts	The number of individually addressed SIP Level 3 PDUs that have been sent by this system across the interface. [identical to <a href="#">RFC1304</a> : sipL3SentIndividualDAs]
ifOutDiscards	The number of SIP Level 3 PDUs discarded in the egress direction. For SMDS interfaces, this counter will always be zero.

ifOutErrors	The number of SIP Level 3 PDUs discarded in the egress direction, because of errors. For SMDS interfaces, this counter will always be zero.
ifName	The textual name of the interface. If not used, this variable contains a zero-length string.
ifInMulticastPkts	The total number of group addressed SIP Level 3 PDUs received from the remote system across the interface. The total includes only unerrored SIP Level 3 PDUs. [identical to <a href="#">RFC1304</a> : sipL3ReceivedGAs]
ifInBroadcastPkts	This variable is not applicable for SMDS interfaces. Therefore, this counter is always zero.
ifOutMulticastPkts	The number of group addressed SIP Level 3 PDUs that have been sent by this system across the interface. [identical to <a href="#">RFC1304</a> : sipL3SentGAs]
ifOutBroadcastPkts	This variable is not applicable for SMDS interfaces. Therefore, this counter is always zero.
ifLinkUpDownTrapEnable	The value of this object is disabled(2) for SIP Level 3 interfaces.
ifHighSpeed	Set to the user data rate of the interface in millions of bits per second. If the user data rate is less than 1 Mbps, then this value is zero.
ifPromiscuousMode	Set to false(2).
ifConnectorPresent	Set to false(2).

Consult the Evolution of the Interfaces Group [9] for when to use the HC (High Capacity) counters (e.g., ifHCInOctets is a 64-bit counter).

DESCRIPTION

"A table that contains the latest occurrence of  
 the following syntactical SIP L3PDU errors:

- Destination Address Field Format Error,

The following pertains to the 60 least significant bits of the 64 bit address field. The 60 bits contained in the address subfield can be used to represent addresses up to 15 decimal digits. Each decimal digit shall be encoded into four bits using Binary Coded Decimal (BCD), with the most significant digit occurring left-most. If not all 15 digits are required, then the remainder of this field shall be padded on the right with bits set to one. An error is considered to have occurred:

a). if the first four bits of the address subfield are not BCD, OR b). if the first four bits of the address subfield are populated with the country code value 0001, AND the 40 bits which follow are not Binary Coded Decimal (BCD) encoded values of the 10 digit addresses, OR the remaining 16 least significant bits are not populated with 1's, OR c). if the address subfield is not correct according to another numbering plan which is dependent upon the carrier assigning the numbers and offering SMDS.

- Source Address Field Format Error,

The description of this parameter is the same as the description of the Destination Address Field Format Error.

- Invalid BAsize Field Value,

An error is considered to have occurred when the BAsize field of an SIP L3PDU contains a value less than 32, greater than 9220 octets without the CRC32 field present, greater than 9224 octets with the CRC32 field present, or not equal to a multiple of 4 octets,

- Invalid Header Extension Length Field Value,

An error is considered to have occurred when the Header Extension Length field value is not equal 3.

- Invalid Header Extension - Element Length,

An error is considered to have occurred when the Header Extension - Element Length is greater than 12.

- Invalid Header Extension - Version Element Position, Length, or Value,

An error is considered to have occurred when a Version element with Length=3, Type=0, and Value=1 does not appear first within the Header Extension, or an element Type=0 appears somewhere other than within the first three octets in the Header Extension.

- Invalid Header Extension - Carrier Selection Element Position, Length, Value or Format,

An error is considered to have occurred when a Carrier Selection element does not appear second within the Header Extension, if the Element Type does not equal 1, the Element Length does not equal 4, 6, or 8, the Element Value field is not four BCD encoded decimal digits used in specifying the Carrier Identification Code (CIC), or the identified CIC code is invalid.

- Header Extension PAD Error

An error is considered to have occurred when the Header Extension PAD is 9 octets in length, or if the Header Extension PAD is greater than zero

octets in length and the Header Extension PAD does not follow all Header Extension elements or does not begin with at least one octet of all zeros.

- Bntag Mismatch Error,

An error is considered to have occurred when the Beginning-End Tags in the SIP L3PDU header and trailer are not equal.

- Bsize Field not equal to Length Field Error,

An error is considered to have occurred when the value of the Bsize Field does not equal the value of the Length Field.

- Incorrect Length Error, and

An error is considered to have occurred when the the Length field value is not equal to the portion of the SIP L3PDU which extends from the Destination Address field up to and including the CRC32 field (if present) or up to and including the PAD field (if the CRC32 field is not present). As an optional check, an error is considered to have occurred when the length of a partially received SIP L3PDU exceeds the Bsize value.

- MRI Timeout Error.

An error is considered to have occurred when the elapsed time between receipt of BOM and corresponding EOM exceeds the value of the MRI (Message Receive Interval) for a particular transport signal format.

An entry is indexed by interface number and error type, and contains Source Address, Destination Address and a timestamp. All these errors are counted in the sipL3Errors counter. When sipL3PDUErrTimeStamps is equal to zero, the SipL3PDUErrEntry does not contain any valid information."

## 7. Security Considerations

Security issues are not discussed in this memo.

## 8. Authors' Addresses

Tracy A. Brown  
Bell Communications Research  
331 Newman Springs Road  
P.O. Box 7020  
Red Bank, NJ 07701-7020

Phone: (908) 758-2107  
EMail: tacox@mail.bellcore.com

Kaj Tesink  
Bell Communications Research  
331 Newman Springs Road  
P.O. Box 7020  
Red Bank, NJ 07701-7020

Phone: (908) 758-5254  
EMail: kaj@cc.bellcore.com
