

Definitions of Managed Objects for Character Stream Devices

Status of this Memo

This RFC specifies an IAB standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "IAB Official Protocol Standards" for the standardization state and status of this protocol. Distribution of this memo is unlimited.

1. Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in TCP/IP based internets. In particular it defines objects for the management of character stream devices.

2. The Network Management Framework

The Internet-standard Network Management Framework consists of three components. They are:

[RFC 1155](#) which defines the SMI, the mechanisms used for describing and naming objects for the purpose of management. [RFC 1212](#) defines a more concise description mechanism, which is wholly consistent with the SMI.

[RFC 1156](#) which defines MIB-I, the core set of managed objects for the Internet suite of protocols. [RFC 1213](#), defines MIB-II, an evolution of MIB-I based on implementation experience and new operational requirements.

[RFC 1157](#) which defines the SNMP, the protocol used for network access to managed objects.

The Framework permits new objects to be defined for the purpose of experimentation and evaluation.

3. Objects

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. Objects in the MIB are

defined using the subset of Abstract Syntax Notation One (ASN.1) [7] defined in the SMI. In particular, each object has a name, a syntax, and an encoding. The name is an object identifier, an administratively assigned name, which specifies an object type.

The object type together with an object instance serves to uniquely identify a specific instantiation of the object. For human convenience, we often use a textual string, termed the OBJECT DESCRIPTOR, to also refer to the object type.

The syntax of an object type defines the abstract data structure corresponding to that object type. The ASN.1 language is used for this purpose. However, the SMI [3] purposely restricts the ASN.1 constructs which may be used. These restrictions are explicitly made for simplicity.

The encoding of an object type is simply how that object type is represented using the object type's syntax. Implicitly tied to the notion of an object type's syntax and encoding is how the object type is represented when being transmitted on the network.

The SMI specifies the use of the basic encoding rules of ASN.1 [8], subject to the additional requirements imposed by the SNMP.

3.1. Format of Definitions

Section 5 contains the specification of all object types contained in this MIB module. The object types are defined using the conventions defined in the SMI, as amended by the extensions specified in [9,10].

4. Overview

The Character MIB applies to interface ports that carry a character stream, whether physical or virtual, serial or parallel, synchronous or asynchronous. The most common example of a character port is a hardware terminal port with an RS-232 interface. Another common hardware example is a parallel printer port, say with a Centronics interface. The concept also includes virtual terminal ports, such as a software connection point for a remote console.

The Character MIB is one of a set of MIBs designed for complementary use. At this writing, the set comprises:

- Character MIB
- PPP MIB
- RS-232-like MIB
- Parallel-printer-like MIB

The RS-232-like MIB and the Parallel-printer-like MIB represent the physical layer, providing service to higher layers such as the Character MIB or PPP MIB. Further MIBs may appear above these.

The following diagram shows two possible "MIB stacks", each using the RS-232-like MIB.

The intent of the model is for the physical-level MIBs to represent the lowest level, regardless of the higher level that may be using it. In turn, separate higher level MIBs represent specific applications, such as a terminal (the Character MIB) or a network connection (the PPP MIB).

For the most part, character ports are distinct from network interfaces (which are already covered by the Interface group). In general, they are attachment points for non-network devices. The exception is a character port that can support a network protocol, such as SLIP or PPP. This implies the existence of a corresponding entry in the Interfaces table, with `ifOperStatus` of 'off' while the port is not running a network protocol and 'on' if it is. The intent is that such usage is exclusive of non-network character stream usage. That is, while switched to network use, `charPortOperStatus` would be 'down' and Character MIB operational values such as `charPortInFlowState` and `charPortInCharacters` would be inactive.

The Character MIB is mandatory for all systems that offer character ports. This includes, for example, terminal servers, general-purpose time-sharing hosts, and even such systems as a bridge with a (virtual) console port. It may or may not include character ports that do not support network sessions, depending on the system's needs.

The Character MIB's central abstraction is a port. Physical ports have a one-to-one correspondence with hardware ports. Virtual ports are software entities analogous to physical ports, but with no hardware connector.

Each port supports one or more sessions. A session represents a virtual connection that carries characters between the port and some

partner. Sessions typically operate over a stack of network protocols. A typical session, for example, uses Telnet over TCP.

The MIB comprises one base object and two tables, detailed in the following sections. The tables contain objects for ports and sessions.

The MIB intentionally contains no distinction between what is often called permanent and operational or volatile data bases. For the purposes of this MIB, handling of such distinctions is implementation specific.

5. Definitions

```
RFC1316-MIB DEFINITIONS ::= BEGIN

    IMPORTS
        Counter, TimeTicks, Gauge
            FROM RFC1155-SMI
        DisplayString
            FROM RFC1213-MIB
        OBJECT-TYPE
            FROM RFC-1212;

    -- this is the MIB module for character stream devices

    char      OBJECT IDENTIFIER ::= { mib-2 19 }

    -- Textual Conventions

    AutonomousType      ::= OBJECT IDENTIFIER

    -- The object identifier is an independently extensible type
    -- identification value. It may, for example indicate a
    -- particular sub-tree with further MIB definitions, or
    -- define something like a protocol type or type of
    -- hardware.

    InstancePointer      ::= OBJECT IDENTIFIER

    -- The object identifier is a pointer to a specific instance
    -- of a MIB object in this agent's implemented MIB. By
    -- convention, it is the first object in the conceptual row
    -- for the instance.
```

```
-- the generic Character group

-- Implementation of this group is mandatory for all
-- systems that offer character ports

charNumber OBJECT-TYPE
    SYNTAX INTEGER
    ACCESS read-only
    STATUS mandatory
    DESCRIPTION
        "The number of entries in charPortTable, regardless
        of their current state."
    ::= { char 1 }

-- the Character Port table

        Gauge,
charPortSessionIndex
        INTEGER
    }
```

charPortIndex OBJECT-TYPE

SYNTAX INTEGER

ACCESS read-only

STATUS mandatory

DESCRIPTION

"A unique value for each character port. Its value ranges between 1 and the value of charNumber. By convention and if possible, hardware port numbers come first, with a simple, direct mapping. The value for each port must remain constant at least from one re-initialization of the network management agent to the next."

::= { charPortEntry 1 }

charPortName OBJECT-TYPE

SYNTAX DisplayString (SIZE (0..32))

ACCESS read-write

STATUS mandatory

DESCRIPTION

"An administratively assigned name for the port, typically with some local significance."

```
::= { charPortEntry 2 }
```

charPortType OBJECT-TYPE

```
SYNTAX INTEGER { physical(1), virtual(2) }
```

```
ACCESS read-only
```

```
STATUS mandatory
```

```
DESCRIPTION
```

"The port's type, 'physical' if the port represents an external hardware connector, 'virtual' if it does not."

```
::= { charPortEntry 3 }
```

charPortHardware OBJECT-TYPE

```
SYNTAX AutonomousType
```

```
ACCESS read-only
```

```
STATUS mandatory
```

```
DESCRIPTION
```

"A reference to hardware MIB definitions specific to a physical port's external connector. For example, if the connector is RS-232, then the value of this object refers to a MIB sub-tree defining objects specific to RS-232. If an agent is not configured to have such values, the agent returns the object identifier:

```
    nullHardware OBJECT IDENTIFIER ::= { 0 0 }
```

"

```
::= { charPortEntry 4 }
```

charPortReset OBJECT-TYPE

```
SYNTAX INTEGER { ready(1), execute(2) }
```

```
ACCESS read-write
```

```
STATUS mandatory
```

```
DESCRIPTION
```

"A control to force the port into a clean, initial state, both hardware and software, disconnecting all the port's existing sessions. In response to a get-request or get-next-request, the agent always returns 'ready' as the value. Setting the value to 'execute' causes a reset."

```
::= { charPortEntry 5 }
```

charPortAdminStatus OBJECT-TYPE

```
SYNTAX INTEGER { enabled(1), disabled(2), off(3),  
                maintenance(4) }
```

```
ACCESS read-write
```

```
STATUS mandatory
```

```
DESCRIPTION
```

"The port's desired state, independent of flow control. 'enabled' indicates that the port is allowed to pass characters and form new sessions. 'disabled' indicates that the port is allowed to pass characters but not form new sessions. 'off' indicates that the port is not allowed to pass characters or have any sessions. 'maintenance' indicates a maintenance mode, exclusive of normal operation, such as running a test."
 ::= { charPortEntry 6 }

charPortOperStatus OBJECT-TYPE

SYNTAX INTEGER { up(1), down(2),
 maintenance(3), absent(4), active(5) }

ACCESS read-only

STATUS mandatory

DESCRIPTION

"The port's actual, operational state, independent of flow control. 'up' indicates able to function normally. 'down' indicates inability to function for administrative or operational reasons. 'maintenance' indicates a maintenance mode, exclusive of normal operation, such as running a test. 'absent' indicates that port hardware is not present. 'active' indicates up with a user present (e.g. logged in)."
 ::= { charPortEntry 7 }

charPortLastChange OBJECT-TYPE

SYNTAX TimeTicks

ACCESS read-only

STATUS mandatory

DESCRIPTION

"The value of sysUpTime at the time the port entered its current operational state. If the current state was entered prior to the last reinitialization of the local network management subsystem, then this object contains a zero value."
 ::= { charPortEntry 8 }

charPortInFlowType OBJECT-TYPE

SYNTAX INTEGER { none(1), xonXoff(2), hardware(3),
 ctsRts(4), dsrDtr(5) }

ACCESS read-write

STATUS mandatory

DESCRIPTION

"The port's type of input flow control. 'none' indicates no flow control at this level or below."

'xonXoff' indicates software flow control by recognizing XON and XOFF characters. 'hardware' indicates flow control delegated to the lower level, for example a parallel port.

'ctsRts' and 'dsrDtr' are specific to RS-232-like ports. Although not architecturally pure, they are included here for simplicity's sake."

::= { charPortEntry 9 }

charPortOutFlowType OBJECT-TYPE

SYNTAX INTEGER { none(1), xonXoff(2), hardware(3),
ctsRts(4), dsrDtr(5) }

ACCESS read-write

STATUS mandatory

DESCRIPTION

"The port's type of output flow control. 'none' indicates no flow control at this level or below. 'xonXoff' indicates software flow control by recognizing XON and XOFF characters. 'hardware' indicates flow control delegated to the lower level, for example a parallel port.

'ctsRts' and 'dsrDtr' are specific to RS-232-like ports. Although not architecturally pure, they are included here for simplicity's sake."

::= { charPortEntry 10 }

charPortInFlowState OBJECT-TYPE

SYNTAX INTEGER { none(1), unknown(2), stop(3), go(4) }

ACCESS read-only

STATUS mandatory

DESCRIPTION

"The current operational state of input flow control on the port. 'none' indicates not applicable. 'unknown' indicates this level does not know. 'stop' indicates flow not allowed. 'go' indicates flow allowed."

::= { charPortEntry 11 }

charPortOutFlowState OBJECT-TYPE

SYNTAX INTEGER { none(1), unknown(2), stop(3), go(4) }

ACCESS read-only

STATUS mandatory

DESCRIPTION

"The current operational state of output flow control on the port. 'none' indicates not applicable. 'unknown' indicates this level does not

know. 'stop' indicates flow not allowed. 'go'
indicates flow allowed."
::= { charPortEntry 12 }

charPortInCharacters OBJECT-TYPE

SYNTAX Counter

ACCESS read-only

STATUS mandatory

DESCRIPTION

"Total number of characters detected as input from the port since system re-initialization and while the port operational state was 'up', 'active', or 'maintenance', including, for example, framing, flow control (i.e. XON and XOFF), each occurrence of a BREAK condition, locally-processed input, and input sent to all sessions."

::= { charPortEntry 13 }

charPortOutCharacters OBJECT-TYPE

SYNTAX Counter

ACCESS read-only

STATUS mandatory

DESCRIPTION

"Total number of characters detected as output to the port since system re-initialization and while the port operational state was 'up', 'active', or 'maintenance', including, for example, framing, flow control (i.e. XON and XOFF), each occurrence of a BREAK condition, locally-created output, and output received from all sessions."

::= { charPortEntry 14 }

charPortAdminOrigin OBJECT-TYPE

SYNTAX INTEGER { dynamic(1), network(2), local(3),
none(4) }

ACCESS read-write

STATUS mandatory

DESCRIPTION

"The administratively allowed origin for establishing session on the port. 'dynamic' allows 'network' or 'local' session establishment. 'none' disallows session establishment."

::= { charPortEntry 15 }

charPortSessionMaximum OBJECT-TYPE

SYNTAX INTEGER

ACCESS read-write

STATUS mandatory

DESCRIPTION

"The maximum number of concurrent sessions allowed on the port. A value of -1 indicates no maximum. Setting the maximum to less than the current number of sessions has unspecified results."

::= { charPortEntry 16 }

charPortSessionNumber OBJECT-TYPE

SYNTAX Gauge

ACCESS read-only

STATUS mandatory

DESCRIPTION

"The number of open sessions on the port that are in the connecting, connected, or disconnecting state."

::= { charPortEntry 17 }

charPortSessionIndex OBJECT-TYPE

SYNTAX INTEGER

ACCESS read-only

STATUS mandatory

DESCRIPTION

"The value of charSessIndex for the port's first or only active session. If the port has no active session, the agent returns the value zero."

::= { charPortEntry 18 }

-- the Character Session table

charSessTable OBJECT-TYPE

SYNTAX SEQUENCE OF CharSessEntry

ACCESS not-accessible

STATUS mandatory

DESCRIPTION

"A list of port session entries."

::= { char 3 }

charSessEntry OBJECT-TYPE

        charSessStartTime
            TimeTicks
    }

charSessPortIndex OBJECT-TYPE
    SYNTAX INTEGER
    ACCESS read-only
    STATUS mandatory
    DESCRIPTION
        "The value of charPortIndex for the port to which
        this session belongs."
    ::= { charSessEntry 1 }

charSessIndex OBJECT-TYPE
    SYNTAX INTEGER
    ACCESS read-only
    STATUS mandatory
    DESCRIPTION
        "The session index in the context of the port, a
        non-zero positive integer. Session indexes within a
        port need not be sequential. Session indexes may be
        reused for different ports. For example, port 1 and
        port 3 may both have a session 2 at the same time.
        Session indexes may have any valid integer value,
        with any meaning convenient to the agent
        implementation."
    ::= { charSessEntry 2 }
```

```
charSessKill OBJECT-TYPE
    SYNTAX INTEGER { ready(1), execute(2) }
    ACCESS read-write
    STATUS mandatory
    DESCRIPTION
        "A control to terminate the session. In response to
        a get-request or get-next-request, the agent always
        returns 'ready' as the value. Setting the value to
        'execute' causes termination."
    ::= { charSessEntry 3 }

charSessState OBJECT-TYPE
    SYNTAX INTEGER { connecting(1), connected(2),
                    disconnecting(3) }
    ACCESS read-only
    STATUS mandatory
    DESCRIPTION
        "The current operational state of the session,
        disregarding flow control. 'connected' indicates
        that character data could flow on the network side
        of session. 'connecting' indicates moving from
        nonexistent toward 'connected'. 'disconnecting'
        indicates moving from 'connected' or 'connecting' to
        nonexistent."
    ::= { charSessEntry 4 }

charSessProtocol OBJECT-TYPE
    SYNTAX AutonomousType
    ACCESS read-only
    STATUS mandatory
    DESCRIPTION
        "The network protocol over which the session is
        running. Other OBJECT IDENTIFIER values may be
        defined elsewhere, in association with specific
        protocols. However, this document assigns those of
        known interest as of this writing."
    ::= { charSessEntry 5 }

    ACCESS read-only
    STATUS mandatory
    DESCRIPTION
        "This session's subset of charPortInCharacters."
    ::= { charSessEntry 7 }

charSessOutCharacters OBJECT-TYPE
    SYNTAX Counter
    ACCESS read-only
    STATUS mandatory
    DESCRIPTION
        "This session's subset of charPortOutCharacters."
    ::= { charSessEntry 8 }

charSessConnectionId OBJECT-TYPE
    SYNTAX InstancePointer
    ACCESS read-only
    STATUS mandatory
    DESCRIPTION
        "A reference to additional local MIB information.
        This should be the highest available related MIB,
        corresponding to charSessProtocol, such as Telnet.
        For example, the value for a TCP connection (in the
        absence of a Telnet MIB) is the object identifier of
        tcpConnState. If an agent is not configured to have
        such values, the agent returns the object
        identifier:

            nullConnectionId OBJECT IDENTIFIER ::= { 0 0 }
        "
    ::= { charSessEntry 9 }

charSessStartTime OBJECT-TYPE
    SYNTAX TimeTicks
    ACCESS read-only
    STATUS mandatory
    DESCRIPTION
        "The value of sysUpTime in MIB-2 when the session
```

```
        entered connecting state."  
 ::= { charSessEntry 10 }
```

END
