

Examples of Protecting Content Using JSON Object Signing and Encryption (JOSE)

Abstract

This document contains a set of examples using JSON Object Signing and Encryption (JOSE) technology to protect data. These examples present a representative sampling of JSON Web Key (JWK) objects as well as various JSON Web Signature (JWS) and JSON Web Encryption (JWE) results given similar inputs.

Status of This Memo

This document is not an Internet Standards Track specification; it is published for informational purposes.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Not all documents approved by the IESG are a candidate for any level of Internet Standard; see [Section 2 of RFC 5741](#).

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at <http://www.rfc-editor.org/info/rfc7520>.

1. Introduction

The JSON Object Signing and Encryption (JOSE) technologies -- JSON Web Signature [JWS], JSON Web Encryption [JWE], JSON Web Key [JWK], and JSON Web Algorithms [JWA] -- can be used collectively to encrypt and/or sign content using a variety of algorithms. While the full set of permutations is extremely large, and might be daunting to some, it is expected that most applications will only use a small set of algorithms to meet their needs.

This document provides a number of examples of signing or encrypting content using JOSE. While not exhaustive, it does compile a representative sampling of JOSE features. As much as possible, the same signature payload or encryption plaintext content is used to illustrate differences in various signing and encryption results.

This document also provides a number of example JWK objects. These examples illustrate the distinguishing properties of various key types and emphasize important characteristics. Most of the JWK examples are then used in the signature or encryption examples that follow.

All of the examples contained herein are available in a machine-readable format at <<https://github.com/ietf-jose/cookbook>>.

1.1. Conventions Used in This Document

This document separates data that are expected to be input to an implementation of JOSE from data that are expected to be generated by an implementation of JOSE. Each example, wherever possible, provides enough information both to replicate the results of this document and to validate the results by running its inverse operation (e.g., signature results can be validated by performing the JWS verify). However, some algorithms inherently use random data; therefore, computations employing them cannot be exactly replicated. Such cases are explicitly stated in the relevant sections.

All instances of binary octet strings are represented using base64url [RFC4648] encoding.

Wherever possible and unless otherwise noted, the examples include the JWS or JWE Compact Serialization, general JWS or JWE JSON Serialization, and flattened JWS or JWE JSON Serialization.

All of the examples in this document have whitespace added to improve formatting and readability. Except for JWE Plaintext or JWS Payload content, whitespace is not part of the cryptographic operations nor the exchange results.

Unless otherwise noted, the JWE Plaintext or JWS Payload content does include " " (U+0020 SPACE) characters. Line breaks (U+000A LINE FEED) replace some " " (U+0020 SPACE) characters to improve readability but are not present in the JWE Plaintext or JWS Payload.

2. Terminology

This document inherits terminology regarding JSON Web Signature (JWS) technology from [JWS], terminology regarding JSON Web Encryption (JWE) technology from [JWE], terminology regarding JSON Web Key (JWK) technology from [JWK], and terminology regarding algorithms from [JWA].

3. JSON Web Key Examples

The following sections demonstrate how to represent various JWK and JWK Set objects.

3.1. EC Public Key

This example illustrates an Elliptic Curve (EC) public key. This example is the public key corresponding to the private key in Figure 2.

Note that whitespace is added for readability as described in Section 1.1.

```
{
  "kty": "EC",
  "kid": "bilbo.baggins@hobbiton.example",
  "use": "sig",
  "crv": "P-521",
  "x": "AHKZLLOsCOzz5cY97ewNUajB957y-C-U88c3v13nmGZx6sYl_oJXu9

  "y": "Adym1HvOiLxXkEhayXQnNCvDX4h9htZaCJN34kfmC6pV5OhQHiraVy
    SsUdaQkAgDPrwQrJmbnX9cwlGfP-HqHZR1"
}
```

Figure 1: Elliptic Curve P-521 Public Key

The field "kty" value of "EC" identifies this as an Elliptic Curve key. The field "crv" identifies the curve, which is curve P-521 for this example. The values of the fields "x" and "y" are the base64url-encoded X and Y coordinates (respectively).

The values of the fields "x" and "y" decoded are the octets necessary to represent each full coordinate to the order of the curve. For a key over curve P-521, the values of the fields "x" and "y" are exactly 66 octets in length when decoded, padded with leading zero (0x00) octets to reach the expected length.

3.2. EC Private Key

This example illustrates an Elliptic Curve private key. This example is the private key corresponding to the public key in Figure 1.

Note that whitespace is added for readability as described in [Section 1.1](#).

```
{
  "kty": "EC",
  "kid": "bilbo.baggins@hobbiton.example",
  "use": "sig",
  "crv": "P-521",
  "x": "AHKZLL0sCOzz5cY97ewNUajB957y-C-U88c3v13nmGZx6sYl_oJXu9
    A5RkTKqjqvjyekWF-7ytDyRXYgCF5cj0Kt",
  "y": "AdymIHvOiLxXkEhayXQnNCvDX4h9htZaCJN34kfmC6pV5OhQHiraVy

    KipQrCW9CGZH3T4ubpnoTKLDYJ_fF3_rJt"
}
```

Figure 2: Elliptic Curve P-521 Private Key

The field "kty" value of "EC" identifies this as an Elliptic Curve key. The field "crv" identifies the curve, which is curve P-521 (also known as SECG curve secp521r1) for this example. The values of the fields "x" and "y" are the base64url-encoded X and Y coordinates (respectively). The field "d" value is the base64url-encoded private key.

The values of the fields "d", "x", and "y" decoded are the octets necessary to represent the private key or each full coordinate (respectively) to the order of the curve. For a key over curve P-521, the values of the "d", "x", and "y" fields are each exactly 66 octets in length when decoded, padded with leading zero (0x00) octets to reach the expected length.

3.3. RSA Public Key

This example illustrates an RSA public key. This example is the public key corresponding to the private key in Figure 4.

Note that whitespace is added for readability as described in [Section 1.1](#).

```
{
  "kty": "RSA",
  "kid": "bilbo.baggins@hobbiton.example",

  "e": "AQAB"
}
```

Figure 3: RSA 2048-Bit Public Key

The field "kty" value of "RSA" identifies this as an RSA key. The fields "n" and "e" values are the modulus and (public) exponent (respectively) using the minimum octets necessary.

For a 2048-bit key, the field "n" value is 256 octets in length when decoded.

3.4. RSA Private Key

This example illustrates an RSA private key. This example is the private key corresponding to the public key in Figure 3.

Note that whitespace is added for readability as described in [Section 1.1](#).

```

```

Figure 4: RSA 2048-Bit Private Key

The field "kty" value of "RSA" identifies this as an RSA key. The fields "n" and "e" values are the base64url-encoded modulus and (public) exponent (respectively) using the minimum number of octets necessary. The field "d" value is the base64url-encoded private exponent using the minimum number of octets necessary. The fields "p", "q", "dp", "dq", and "qi" are the base64url-encoded additional private information using the minimum number of octets necessary.

For a 2048-bit key, the field "n" is 256 octets in length when decoded, and the field "d" is not longer than 256 octets in length when decoded.

3.5. Symmetric Key (MAC Computation)

This example illustrates a symmetric key used for computing Message Authentication Codes (MACs).

Note that whitespace is added for readability as described in [Section 1.1](#).

```
{
  "kty": "oct",
  "kid": "018c0ae5-4d9b-471b-bfd6-eef314bc7037",
  "use": "sig",
  "alg": "HS256",
  "k": "hJtXIZ2uSN5kbQfbtTNWbpdmhkV8FJG-Onbc6mxCcYg"
}
```

Figure 5: HMAC SHA-256 Symmetric Key

The field "kty" value of "oct" identifies this as a symmetric key. The field "k" value is the symmetric key.

When used for the signing algorithm "HS256" (HMAC-SHA256), the field "k" value is 32 octets (or more) in length when decoded, padded with leading zero (0x00) octets to reach the minimum expected length.

3.6. Symmetric Key (Encryption)

This example illustrates a symmetric key used for encryption.

Note that whitespace is added for readability as described in [Section 1.1](#).

```
{
  "kty": "oct",
  "kid": "1e571774-2e08-40da-8308-e8d68773842d",
  "use": "enc",
  "alg": "A256GCM",
  "k": "AAPapAv4LbFbiVawEjagUBluYqN5rhna-8nuldDvOx8"
}
```

Figure 6: AES 256-Bit Symmetric Encryption Key

The field "kty" value of "oct" identifies this as a symmetric key. The field "k" value is the symmetric key.

For the content encryption algorithm "A256GCM", the field "k" value is exactly 32 octets in length when decoded, padded with leading zero (0x00) octets to reach the expected length.

4. JSON Web Signature Examples

The following sections demonstrate how to generate various JWS objects.

All of the signature examples use the following payload content (an abridged quote from "The Fellowship of the Ring" [[LOTR-FELLOWSHIP](#)]), serialized as UTF-8. The payload is presented here as a series of quoted strings that are concatenated to produce the JWS Payload. The sequence "\xe2\x80\x99" is substituted for (U+2019 RIGHT SINGLE QUOTATION MARK), and quotation marks (U+0022 QUOTATION MARK) are added for readability but are not present in the JWS Payload.

```
"It\xe2\x80\x99s a dangerous business, Frodo, going out your "
"door. You step onto the road, and if you don't keep your feet, "
"there\xe2\x80\x99s no knowing where you might be swept off "
"to."
```

Figure 7: Payload Content Plaintext

The payload -- with the sequence `"\xe2\x80\x99"` replaced with (U+2019 RIGHT SINGLE QUOTATION MARK) and quotations marks (U+0022 QUOTATION MARK) are removed -- is encoded as UTF-8 and then as base64url [RFC4648]:

```
SXTigJlzigEGZGFuZ2VyY3VzIGJlc2luZXNzLCBGcm9kbywgZ29pbmcgb3V0IHlvdXlzigZG9vci4gWW91IHN0ZXAgb250byB0aGUgcm9hZCwgYW5kIGlmIHlvdSBkb24ndCBrc2VwIHlvdXlzigZmVldCwgdGhlcmXigJlzig5vIGtub3dpbmcd2hlcmUgeW91IGlpc2h0IGJlIHN3ZXB0IG9mZiB0by4
```

Figure 8: Payload Content, base64url-encoded

4.1. RSA v1.5 Signature

This example illustrates signing content using the "RS256" (RSASSA-PKCS1-v1_5 with SHA-256) algorithm.

Note that whitespace is added for readability as described in [Section 1.1](#).

4.1.1. Input Factors

The following are supplied before beginning the signing operation:

- o Payload content; this example uses the content from Figure 7, encoded using base64url [RFC4648] to produce Figure 8.
- o RSA private key; this example uses the key from Figure 4.
- o "alg" parameter of "RS256".

4.1.2. Signing Operation

The following is generated to complete the signing operation:

- o JWS Protected Header; this example uses the header from Figure 9, encoded using base64url [RFC4648] to produce Figure 10.

```
{
  "alg": "RS256",
  "kid": "bilbo.baggins@hobbiton.example"
}
```

Figure 9: JWS Protected Header JSON

```
eyJhbGciOiJSUzI1NiIsImtpZCI6ImJpbGJvLmJhZ2dpbnNAaG9iYml0b24uZXh1bXBsZSJ9
```

Figure 10: JWS Protected Header, base64url-encoded

The JWS Protected Header (Figure 10) and JWS Payload (Figure 8) are combined as described in Section 5.1 of [JWS] to produce the JWS Signing Input (Figure 11).

```
eyJhbGciOiJSUzI1NiIsImtpZCI6ImJpbGJvLmJhZ2dpbnNAaG9iYml0b24uZXh1bXBsZSJ9
.
SXTigJlzigEGZGFuZ2VyY3VzIGJlc2luZXNzLCBGcm9kbywgZ29pbmcgb3V0IHlvdXlzigZG9vci4gWW91IHNOZXAgb250byB0aGUgc9hZCwgYW5kIGlmIHlvdSBkb24ndCBzZWVwIHlvdXlzigZmVldCwgdGhlcmXigJlzigZ5vIGtub3dpbmcd2hlcmUgeW91IGlpc2h0IGJlIHNOZXB0IG9mZiB0by4
```

Figure 11: JWS Signing Input

Performing the signature operation over the JWS Signing Input (Figure 11) produces the JWS Signature (Figure 12).

Figure 15: Flattened JWS JSON Serialization

4.2. RSA-PSS Signature

This example illustrates signing content using the "PS384" (RSASSA-PSS with SHA-384) algorithm.

Note that RSASSA-PSS uses random data to generate the signature; it might not be possible to exactly replicate the results in this section.

Note that whitespace is added for readability as described in [Section 1.1](#).

4.2.1. Input Factors

The following are supplied before beginning the signing operation:

- o Payload content; this example uses the content from Figure 7, encoded using base64url [\[RFC4648\]](#) to produce Figure 8.
- o RSA private key; this example uses the key from Figure 4.
- o "alg" parameter of "PS384".

4.2.2. Signing Operation

The following is generated to complete the signing operation:

- o JWS Protected Header; this example uses the header from Figure 16, encoded using base64url [RFC4648] to produce Figure 17.

```
{
  "alg": "PS384",
  "kid": "bilbo.baggins@hobbiton.example"
}
```

4.3. ECDSA Signature

This example illustrates signing content using the "ES512" (Elliptic Curve Digital Signature Algorithm (ECDSA) with curve P-521 and SHA-512) algorithm.

Note that ECDSA uses random data to generate the signature; it might not be possible to exactly replicate the results in this section.

Note that whitespace is added for readability as described in [Section 1.1](#).

4.3.1. Input Factors

The following are supplied before beginning the signing operation:

- o Payload content; this example uses the content from Figure 7, encoded using base64url [[RFC4648](#)] to produce Figure 8.
- o EC private key on the curve P-521; this example uses the key from Figure 2.
- o "alg" parameter of "ES512".

4.3.2. Signing Operation

The following is generated before beginning the signature process:

- o JWS Protected Header; this example uses the header from Figure 23, encoded using base64url [[RFC4648](#)] to produce Figure 24.

```
{
  "alg": "ES512",
  "kid": "bilbo.baggins@hobbiton.example"

4.4. HMAC-SHA2 Integrity Protection

This example illustrates integrity protecting content using the "HS256" (HMAC-SHA-256) algorithm.

Note that whitespace is added for readability as described in [Section 1.1](#).

4.4.1. Input Factors

The following are supplied before beginning the signing operation:

- o Payload content; this example uses the content from Figure 7, encoded using base64url [RFC4648] to produce Figure 8.
- o HMAC symmetric key; this example uses the key from Figure 5.
- o "alg" parameter of "HS256".

4.4.2. Signing Operation

The following is generated before completing the signing operation:

- o JWS Protected Header; this example uses the header from Figure 30, encoded using base64url [RFC4648] to produce Figure 31.

```
{
  "alg": "HS256",

4.5. Signature with Detached Content

This example illustrates a signature with detached content. This example is identical to other examples in [Section 4](#), except the resulting JWS objects do not include the JWS Payload field. Instead, the application is expected to locate it elsewhere. For example, the signature might be in a metadata section, with the payload being the content.

Note that whitespace is added for readability as described in [Section 1.1](#).

4.5.1. Input Factors

The following are supplied before beginning the signing operation:

- o Payload content; this example uses the content from Figure 7, encoded using base64url [RFC4648] to produce Figure 8.
- o Signing key; this example uses the AES symmetric key from Figure 5.
- o Signing algorithm; this example uses "HS256".

4.5.2. Signing Operation

The following is generated before completing the signing operation:

- o JWS Protected Header; this example uses the header from Figure 37, encoded using base64url [RFC4648] to produce Figure 38.

```
{
  "alg": "HS256",
  "kid": "018c0ae5-4d9b-471b-bfd6-eef314bc7037"
}

Figure 43: Flattened JWS JSON Serialization

4.6. Protecting Specific Header Fields

This example illustrates a signature where only certain Header Parameters are protected. Since this example contains both unprotected and protected Header Parameters, only the general JWS JSON Serialization and flattened JWS JSON Serialization are possible.

Note that whitespace is added for readability as described in [Section 1.1](#).

4.6.1. Input Factors

The following are supplied before beginning the signing operation:

- o Payload content; this example uses the content from Figure 7, encoded using base64url [\[RFC4648\]](#) to produce Figure 8.
- o Signing key; this example uses the AES symmetric key from Figure 5.
- o Signing algorithm; this example uses "HS256".

4.6.2. Signing Operation

The following are generated before completing the signing operation:

- o JWS Protected Header; this example uses the header from Figure 44, encoded using base64url [\[RFC4648\]](#) to produce Figure 45.
- o JWS Unprotected Header; this example uses the header from Figure 46.

```
{
  "alg": "HS256"
}
```

}
```

Figure 55: Flattened JWS JSON Serialization

4.8. Multiple Signatures

This example illustrates multiple signatures applied to the same payload. Since this example contains more than one signature, only the JSON General Serialization is possible.

Note that whitespace is added for readability as described in [Section 1.1](#).

4.8.1. Input Factors

The following are supplied before beginning the signing operation:

- o Payload content; this example uses the content from Figure 7, encoded using base64url [\[RFC4648\]](#) to produce Figure 8.
- o Signing keys; this example uses the following:
 - * RSA private key from Figure 4 for the first signature
 - * EC private key from Figure 2 for the second signature
 - * AES symmetric key from Figure 5 for the third signature
- o Signing algorithms; this example uses the following:
 - * "RS256" for the first signature
 - * "ES512" for the second signature
 - * "HS256" for the third signature

4.8.2. First Signing Operation

The following are generated before completing the first signing operation:

- o JWS Protected Header; this example uses the header from Figure 56, encoded using base64url [RFC4648] to produce Figure 57.
- o JWS Unprotected Header; this example uses the header from Figure 58.

```
{
  "alg": "RS256"
}

}
```

Figure 71: General JWS JSON Serialization

5. JSON Web Encryption Examples

The following sections demonstrate how to generate various JWE objects.

All of the encryption examples (unless otherwise noted) use the following Plaintext content (an abridged quote from "The Fellowship of the Ring" [LOTR-FELLOWSHIP]), serialized as UTF-8. The Plaintext is presented here as a series of quoted strings that are concatenated to produce the JWE Plaintext. The sequence "\xe2\x80\x93" is substituted for (U+2013 EN DASH), and quotation marks (U+0022 QUOTATION MARK) are added for readability but are not present in the JWE Plaintext.

```
"You can trust us to stick with you through thick and "  
"thin\xe2\x80\x93to the bitter end. And you can trust us to "  
"keep any secret of yours\xe2\x80\x93closer than you keep it "  
"yourself. But you cannot trust us to let you face trouble "  
"alone, and go off without a word. We are your friends, Frodo."
```

Figure 72: Plaintext Content

5.1. Key Encryption Using RSA v1.5 and AES-HMAC-SHA2

This example illustrates encrypting content using the "RSA1_5" (RSAES-PKCS1-v1_5) key encryption algorithm and the "A128CBC-HS256" (AES-128-CBC-HMAC-SHA-256) content encryption algorithm.

Note that RSAES-PKCS1-v1_5 uses random data to generate the ciphertext; it might not be possible to exactly replicate the results in this section.

Note that only the RSA public key is necessary to perform the encryption. However, the example includes the RSA private key to allow readers to validate the output.

Note that whitespace is added for readability as described in [Section 1.1](#).

5.1.1. Input Factors

The following are supplied before beginning the encryption process:

- o Plaintext content; this example uses the content from Figure 72.
- o RSA public key; this example uses the key from Figure 73.

```

o  "alg" parameter of "RSA1_5".

o  "enc" parameter of "A128CBC-HS256".

Figure 83: Flattened JWE JSON Serialization

5.2. Key Encryption Using RSA-OAEP with AES-GCM

This example illustrates encrypting content using the "RSA-OAEP" (RSAES-OAEP) key encryption algorithm and the "A256GCM" (AES-GCM) content encryption algorithm.

Note that RSAES-OAEP uses random data to generate the ciphertext; it might not be possible to exactly replicate the results in this section.

Note that only the RSA public key is necessary to perform the encryption. However, the example includes the RSA private key to allow readers to validate the output.

Note that whitespace is added for readability as described in [Section 1.1](#).

5.2.1. Input Factors

The following are supplied before beginning the encryption process:

- o Plaintext content; this example uses the Plaintext from Figure 72.
- o RSA public key; this example uses the key from Figure 84.
- o "alg" parameter of "RSA-OAEP".
- o "enc" parameter of "A256GCM".

Figure 94: Flattened JWE JSON Serialization

5.3. Key Wrap Using PBES2-AES-KeyWrap with AES-CBC-HMAC-SHA2

The example illustrates encrypting content using the "PBES2-HS512+A256KW" (PBES2 Password-based Encryption using HMAC-SHA-512 and AES-256-KeyWrap) key encryption algorithm with the "A128CBC-HS256" (AES-128-CBC-HMAC-SHA-256) content encryption algorithm.

A common use of password-based encryption is the import/export of keys. Therefore, this example uses a JWK Set for the Plaintext content instead of the Plaintext from Figure 72.

Note that if password-based encryption is used for multiple recipients, it is expected that each recipient use different values for the PBES2 parameters "p2s" and "p2c".

Note that whitespace is added for readability as described in [Section 1.1](#).

5.3.1. Input Factors

The following are supplied before beginning the encryption process:

- o Plaintext content; this example uses the Plaintext from Figure 95 (NOTE: All whitespace was added for readability).
- o Password; this example uses the password from Figure 96 -- with the sequence "\xe2\x80\x93" replaced with (U+2013 EN DASH).
- o "alg" parameter of "PBES2-HS512+A256KW".
- o "enc" parameter of "A128CBC-HS256".

```
{
  "keys": [
    {
      "kty": "oct",

```

Figure 96: Password

5.3.2. Generated Factors

The following are generated before encrypting:

- o AES symmetric key as the Content Encryption Key (CEK); this example uses the key from Figure 97.
- o Initialization Vector; this example uses the Initialization Vector from Figure 98.

```
uwsjJXaBK407Qaf0_zpcpmr1Cs0CC50hIUEyGNEt3m0
```

Figure 97: Content Encryption Key, base64url-encoded

```
VBiCzVHNoLiR3F4V82uoTQ
```

Figure 98: Initialization Vector, base64url-encoded

5.3.3. Encrypting the Key

The following are generated before encrypting the CEK:

- o Salt input; this example uses the salt input from Figure 99.
- o Iteration count; this example uses the iteration count 8192.

```
8Q1SzinAsR3xchYz6ZZcHA
```

Figure 99: Salt Input, base64url-encoded

Performing the key encryption operation over the CEK (Figure 97) with the following:

- o Password (Figure 96);
- o Salt input (Figure 99), encoded as an octet string; and
- o Iteration count (8192)

produces the following Encrypted Key:

```
d3qNhUWfqheyPp4H8sjOWsDYajoej4c5Je6rlUtFPWdgtURtmeDVlg
```

Figure 100: Encrypted Key, base64url-encoded

5.3.4. Encrypting the Content

The following is generated before encrypting the content:

- o JWE Protected Header; this example uses the header from Figure 101, encoded using base64url [RFC4648] to produce Figure 102.

```
{
  "alg": "PBES2-HS512+A256KW",
  "p2s": "8Q1SzinAsR3xchYz6ZZcHA",
  "p2c": 8192,
  "cty": "jwk-set+json",
  "enc": "A128CBC-HS256"
}

Figure 107: Flattened JWE JSON Serialization

5.4. Key Agreement with Key Wrapping Using ECDH-ES and AES-KeyWrap with AES-GCM

This example illustrates encrypting content using the "ECDH-ES+A128KW" (Elliptic Curve Diffie-Hellman Ephemeral-Static with AES-128-KeyWrap) key encryption algorithm and the "A128GCM" (AES-GCM) content encryption algorithm.

Note that only the EC public key is necessary to perform the key agreement. However, the example includes the EC private key to allow readers to validate the output.

Note that whitespace is added for readability as described in [Section 1.1](#).

5.4.1. Input Factors

The following are supplied before beginning the encryption process:

- o Plaintext content; this example uses the content from Figure 72.
- o EC public key; this example uses the public key from Figure 108.

- o "alg" parameter of "ECDH-ES+A128KW".
- o "enc" parameter of "A128GCM".

```
{
  "kty": "EC",
  "kid": "peregrin.took@tuckborough.example",
  "use": "enc",
  "crv": "P-384",
  "x": "YU4rRUzdmVqmRtWOs2OpDE_T5fsNIodcG8G5FWPrTPMyxpzsSOGaQL

    SkgaFLlETP",
  "d": "iTxx2pk7wW-GqJkHcEkFQb2EFyYcO7RugmaW3mRrQVAOUiPommT0Idn
    YK2xDlZh-j"
}
```

Figure 108: Elliptic Curve P-384 Key, in JWK Format

(NOTE: While the key includes the private parameters, only the public parameters "crv", "x", and "y" are necessary for the encryption operation.)

5.4.2. Generated Factors

The following are generated before encrypting:

- o AES symmetric key as the Content Encryption Key (CEK); this example uses the key from Figure 109.
- o Initialization Vector; this example uses the Initialization Vector from Figure 110.

Nou2ueKlP70ZXDbq9UrRwg

Figure 109: Content Encryption Key, base64url-encoded

mH-G2zVqgztUtnW_

Figure 110: Initialization Vector, base64url-encoded

5.4.3. Encrypting the Key

To encrypt the Content Encryption Key, the following is generated:

- o Ephemeral EC private key on the same curve as the EC public key; this example uses the private key from Figure 111.

```
{
  "kty": "EC",
  "crv": "P-384",
  "x": "uBo4kHPw6kbjx5l0xowrd_oYzBmaz-GKFZu4xAFFkbYiWgutEK6iuE
    DsQ6wNdNg3",

Figure 119: Flattened JWE JSON Serialization

5.5. Key Agreement Using ECDH-ES with AES-CBC-HMAC-SHA2

This example illustrates encrypting content using the "ECDH-ES" (Elliptic Curve Diffie-Hellman Ephemeral-Static) key agreement algorithm and the "A128CBC-HS256" (AES-128-CBC-HMAC-SHA-256) content encryption algorithm.

Note that only the EC public key is necessary to perform the key agreement. However, the example includes the EC private key to allow readers to validate the output.

Note that whitespace is added for readability as described in [Section 1.1](#).

5.5.1. Input Factors

The following are supplied before beginning the encryption process:

- o Plaintext content; this example uses the content from Figure 72.
- o EC public key; this example uses the public key from Figure 120.
- o "alg" parameter of "ECDH-ES".
- o "enc" parameter of "A128CBC-HS256".

```
{
  "kty": "EC",
  "kid": "meriadoc.brandybuck@buckland.example",
  "use": "enc",
  "crv": "P-256",
  "x": "Ze2loSV3wrroKUN_4zhwGhCqo3Xhultd4QjeQ5wIVR0",
  "y": "HlLtdXARY_f55A3fnzQbPcm6hgr34Mp8p-nuzQCE0Zw",
  "d": "r_kHyZ-a06rmxM3yESK84rlotSg-aQcVStkRhA-iCM8"
}
```

Figure 120: Elliptic Curve P-256 Key

(NOTE: While the key includes the private parameters, only the public parameters "crv", "x", and "y" are necessary for the encryption operation.)

5.5.2. Generated Factors

The following is generated before encrypting:

- o Initialization Vector; this example uses the Initialization Vector from Figure 121.

yc9N8v5sYyv3iGQT926IUg

Figure 121: Initialization Vector, base64url-encoded

NOTE: The Content Encryption Key (CEK) is not randomly generated; instead, it is determined using ECDH-ES key agreement.

5.5.3. Key Agreement

The following is generated to agree on a CEK:

- o Ephemeral private key; this example uses the private key from Figure 122.

```
{
  "kty": "EC",
  "crv": "P-256",
  "x": "mPUKT_bAWGHIhg0TpjjqVsPlrXWQu_vwVOHhtNkdYoA",
  "y": "8BQAsImGeAS46fyWw5MhYfGTT0IjBpFw2SS34Dv4Irs",
  "d": "AtH35vJsQ9SGjYfOsUxYXQKrPH3FjZHmEtSKoSN8cM"
}
```

Figure 122: Ephemeral Private Key, in JWK Format

Performing the ECDH operation using the static EC public key (Figure 120) over the ephemeral private key (Figure 122) produces the following CEK:

```
hzHdlfQIAEehb8Hrd_mFRhKsKLEzPfshfXs9l6areCc
```

Figure 123: Agreed-to Content Encryption Key, base64url-encoded

5.5.4. Encrypting the Content

The following is generated before encrypting the content:

- o JWE Protected Header; this example uses the header from Figure 124, encoded to base64url [RFC4648] as Figure 125.

```
{
  "alg": "ECDH-ES",
  "kid": "meriadoc.brandybuck@buckland.example",
  "epk": {
    "kty": "EC",
    "crv": "P-256",
    "x": "mPUKT_bAWGHIhg0TpjjqVsPlrXWQu_vwVOHhtNkdYoA",
    "y": "8BQAsImGeAS46fyWw5MhYfGTT0IjBpFw2SS34Dv4Irs"
  },
  "enc": "A128CBC-HS256"
}
```

5.6. Direct Encryption Using AES-GCM

This example illustrates encrypting content using a previously exchanged key directly and the "A128GCM" (AES-GCM) content encryption algorithm.

Note that whitespace is added for readability as described in [Section 1.1](#).

5.6.1. Input Factors

The following are supplied before beginning the encryption process:

- o Plaintext content; this example uses the content from Figure 72.
- o AES symmetric key as the Content Encryption Key (CEK); this example uses the key from Figure 130.
- o "alg" parameter of "dir".
- o "enc" parameter of "A128GCM".

```
{
  "kty": "oct",
  "kid": "77c7e2b8-6e13-45cf-8672-617b5b45243a",
  "use": "enc",
  "alg": "A128GCM",
  "k": "XctOhJAKA-pD9Lh7ZgW_2A"
}
```

Figure 130: AES 128-Bit Key, in JWK Format

5.6.2. Generated Factors

The following is generated before encrypting:

- o Initialization Vector; this example uses the Initialization Vector from Figure 131.

refa467QzzKx6QAB

Figure 131: Initialization Vector, base64url-encoded

5.6.3. Encrypting the Content

The following is generated before encrypting the content:

- o JWE Protected Header; this example uses the header from Figure 132, encoded as base64url [RFC4648] to produce Figure 133.

```
{
  "alg": "dir",
  "kid": "77c7e2b8-6e13-45cf-8672-617b5b45243a",

5.8. Key Wrap Using AES-KeyWrap with AES-GCM

The following example illustrates content encryption using the "A128KW" (AES-128-KeyWrap) key encryption algorithm and the "A128GCM" (AES-128-GCM) content encryption algorithm.

Note that whitespace is added for readability as described in [Section 1.1](#).

5.8.1. Input Factors

The following are supplied before beginning the encryption process:

- o Plaintext content; this example uses the content from Figure 72.
- o AES symmetric key; this example uses the key from Figure 151.
- o "alg" parameter of "A128KW".
- o "enc" parameter of "A128GCM".

```
{
  "kty": "oct",
  "kid": "81b20965-8332-43d9-a468-82160ad91ac8",
  "use": "enc",
  "alg": "A128KW",
  "k": "GZy6sIZ6wl9NJOKB-jnmVQ"
}
```

Figure 151: AES 128-Bit Key

5.8.2. Generated Factors

The following are generated before encrypting:

- o AES symmetric key as the Content Encryption Key; this example uses the key from Figure 152.
- o Initialization Vector; this example uses the Initialization Vector from Figure 153.

```
aY5_Ghmk9KxWPBLu_glxlw
```

Figure 152: Content Encryption Key, base64url-encoded

```
Qx0pmsDa8KnJc9Jo
```

Figure 153: Initialization Vector, base64url-encoded

5.8.3. Encrypting the Key

Performing the key encryption operation over the CEK (Figure 152) with the AES symmetric key (Figure 151) produces the following Encrypted Key:

```
CBI6oDw8MydIx1IBntf_lQcw2MmJKIQx
```

Figure 154: Encrypted Key, base64url-encoded

5.8.4. Encrypting the Content

The following is generated before encrypting the content:

- o JWE Protected Header; this example uses the header from Figure 155, encoded to base64url [RFC4648] as Figure 156.

```
{
  "alg": "A128KW",
  "kid": "81b20965-8332-43d9-a468-82160ad91ac8",
  "enc": "A128GCM"
}
```

Figure 161: Flattened JWE JSON Serialization

5.9. Compressed Content

This example illustrates encrypting content that is first compressed. It reuses the AES symmetric key, key encryption algorithm, and content encryption algorithm from [Section 5.8](#).

Note that whitespace is added for readability as described in [Section 1.1](#).

5.9.1. Input Factors

The following are supplied before beginning the encryption process:

- o Plaintext content; this example uses the content from Figure 72.
- o Recipient encryption key; this example uses the key from Figure 151.
- o Key encryption algorithm; this example uses "A128KW".
- o Content encryption algorithm; this example uses "A128GCM".
- o "zip" parameter of "DEF".

5.9.2. Generated Factors

The following are generated before encrypting:

- o Compressed Plaintext from the original Plaintext content; compressing Figure 72 using the DEFLATE [[RFC1951](#)] algorithm produces the compressed Plaintext from Figure 162.
- o AES symmetric key as the Content Encryption Key (CEK); this example uses the key from Figure 163.
- o Initialization Vector; this example uses the Initialization Vector from Figure 164.

```

Figure 172: Flattened JWE JSON Serialization

5.10. Including Additional Authenticated Data

This example illustrates encrypting content that includes additional authenticated data. As this example includes an additional top-level property not present in the JWE Compact Serialization, only the flattened JWE JSON Serialization and general JWE JSON Serialization are possible.

Note that whitespace is added for readability as described in [Section 1.1](#).

5.10.1. Input Factors

The following are supplied before beginning the encryption process:

- o Plaintext content; this example uses the content from Figure 72.
- o Recipient encryption key; this example uses the key from Figure 151.
- o Key encryption algorithm; this example uses "A128KW".
- o Content encryption algorithm; this example uses "A128GCM".
- o Additional Authenticated Data; this example uses a vCard [[RFC7095](#)] from Figure 173, serialized to UTF-8.

```
[
  "vcard",
  [
    [ "version", {}, "text", "4.0" ],
    [ "fn", {}, "text", "Meriadoc Brandybuck" ],
    [ "n", {},
      "text", [
        "Brandybuck", "Meriadoc", "Mr.", ""
      ]
    ],
    [ "bday", {}, "text", "TA 2982" ],
    [ "gender", {}, "text", "M" ]
  ]
]
```

Figure 173: Additional Authenticated Data, in JSON Format

NOTE: Whitespace between JSON values was added for readability.

5.10.2. Generated Factors

The following are generated before encrypting:

- o AES symmetric key as the Content Encryption Key (CEK); this example uses the key from Figure 174.
- o Initialization Vector; this example uses the Initialization Vector from Figure 175.
- o Encoded Additional Authenticated Data (AAD); this example uses the Additional Authenticated Data from Figure 173, encoded to base64url [RFC4648] as Figure 176.

Figure 183: Flattened JWE JSON Serialization

5.11. Protecting Specific Header Fields

This example illustrates encrypting content where only certain JOSE Header Parameters are protected. As this example includes parameters in the JWE Shared Unprotected Header, only the general JWE JSON Serialization and flattened JWE JSON Serialization are possible.

Note that whitespace is added for readability as described in [Section 1.1](#).

5.11.1. Input Factors

The following are supplied before beginning the encryption process:

- o Plaintext content; this example uses the content from Figure 72.
- o Recipient encryption key; this example uses the key from Figure 151.
- o Key encryption algorithm; this example uses "A128KW".
- o Content encryption algorithm; this example uses "A128GCM".

5.11.2. Generated Factors

The following are generated before encrypting:

- o AES symmetric key as the Content Encryption Key (CEK); this example uses the key from Figure 184.
- o Initialization Vector; this example uses the Initialization Vector from Figure 185.

```
WDgEptBmQs9ouUvArz6x6g
```

Figure 184: Content Encryption Key, base64url-encoded

```
WgEJsDS9bkoXQ3nR
```

Figure 185: Initialization Vector, base64url-encoded

5.11.3. Encrypting the Key

Performing the key encryption operation over the CEK (Figure 184) with the AES symmetric key (Figure 151) produces the following Encrypted Key:

```
jJIcM9J-hbx3wnqhf5FlkEYos0sHsF0H
```

Figure 186: Encrypted Key, base64url-encoded

5.11.4. Encrypting the Content

The following is generated before encrypting the content:

- o JWE Protected Header; this example uses the header from Figure 187, encoded to base64url [RFC4648] as Figure 188.

```
{  
  "enc": "A128GCM"  
}
```

Figure 187: JWE Protected Header JSON

```
eyJlbmMiOiJBMTI4R0NNIn0
```

Figure 188: JWE Protected Header, base64url-encoded

Performing the content encryption operation over the Plaintext with the following:

- o CEK (Figure 184);
- o Initialization Vector (Figure 185); and
- o JWE Protected Header (Figure 188) as authenticated data

produces the following:

- o Ciphertext from Figure 189.
- o Authentication Tag from Figure 190.

```

```

Figure 190: Authentication Tag, base64url-encoded

5.11.5. Output Results

The following compose the resulting JWE object:

- o JWE Shared Unprotected Header (Figure 191)
- o JWE Protected Header (Figure 188)
- o Encrypted Key (Figure 186)
- o Initialization Vector (Figure 185)
- o Ciphertext (Figure 189)
- o Authentication Tag (Figure 190)

The JWE Compact Serialization is not presented because it does not support this use case.

The following JWE Shared Unprotected Header is generated before assembling the output results:

```
{
  "alg": "A128KW",
  "kid": "81b20965-8332-43d9-a468-82160ad91ac8"
}
```

Figure 193: Flattened JWE JSON Serialization

5.12. Protecting Content Only

This example illustrates encrypting content where none of the JOSE header parameters are protected. As this example includes parameters only in the JWE Shared Unprotected Header, only the flattened JWE JSON Serialization and general JWE JSON Serialization are possible.

Note that whitespace is added for readability as described in [Section 1.1](#).

5.12.1. Input Factors

The following are supplied before beginning the encryption process:

- o Plaintext content; this example uses the content from Figure 72.
- o Recipient encryption key; this example uses the key from Figure 151.
- o Key encryption algorithm; this example uses "A128KW".
- o Content encryption algorithm; this example uses "A128GCM".

5.12.2. Generated Factors

The following are generated before encrypting:

- o AES symmetric key as the Content Encryption Key; this example the key from Figure 194.
- o Initialization Vector; this example uses the Initialization Vector from Figure 195.

```
KBooAF130QPv3vkcZlXnzQ
```

Figure 194: Content Encryption Key, base64url-encoded

```
YihBoVOGsR1l7jCD
```

Figure 195: Initialization Vector, base64url-encoded

5.12.3. Encrypting the Key

Performing the key encryption operation over the CEK (Figure 194) with the AES symmetric key (Figure 151) produces the following Encrypted Key:

```
244YHfO_W7RMpQW8lUjQrZcq5LSyqiPv
```

Figure 196: Encrypted Key, base64url-encoded

5.12.4. Encrypting the Content

Performing the content encryption operation over the Plaintext (Figure 72) using the following:

- o CEK (Figure 194);
- o Initialization Vector (Figure 195); and
- o Empty string as authenticated data

produces the following:

- o Ciphertext from Figure 197.
- o Authentication Tag from Figure 198.

Figure 201: Flattened JWE JSON Serialization

5.13. Encrypting to Multiple Recipients

This example illustrates encryption content for multiple recipients. As this example has multiple recipients, only the general JWE JSON Serialization is possible.

Note that RSAES-PKCS1-v1_5 uses random data to generate the ciphertext; it might not be possible to exactly replicate the results in this section.

Note that whitespace is added for readability as described in [Section 1.1](#).

5.13.1. Input Factors

The following are supplied before beginning the encryption process:

- o Plaintext content; this example uses the Plaintext from Figure 72.
- o Recipient keys; this example uses the following:
 - * The RSA public key from Figure 73 for the first recipient.
 - * The EC public key from Figure 108 for the second recipient.
 - * The AES symmetric key from Figure 138 for the third recipient.
- o Key encryption algorithms; this example uses the following:
 - * "RSA1_5" for the first recipient.
 - * "ECDH-ES+A256KW" for the second recipient.
 - * "A256GCMKW" for the third recipient.
- o Content encryption algorithm; this example uses "A128CBC-HS256".

5.13.2. Generated Factors

The following are generated before encrypting:

- o AES symmetric key as the Content Encryption Key (CEK); this example uses the key from Figure 202.
- o Initialization Vector; this example uses the Initialization Vector from Figure 203.

```
zXayeJ4gvm8NJr3IUInyokTUO-LbQNKHe_zWlYbdpQ
```

Figure 202: Content Encryption Key, base64url-encoded

  }
}
```

Figure 215: Recipient #3 JSON

5.13.6. Encrypting the Content

The following is generated before encrypting the content:

- o JWE Protected Header; this example uses the header from Figure 216, encoded to base64url [RFC4648] as Figure 217.

```
{  
  "enc": "A128CBC-HS256"  
}
```

Figure 216: JWE Protected Header JSON

```
eyJlbmMiOiJBMTI4Q0JDLUhTMjU2In0
```

Figure 217: JWE Protected Header, base64url-encoded

Performing the content encryption operation over the Plaintext (Figure 72) with the following:

- o CEK (Figure 202),
 - o Initialization Vector (Figure 203), and
 - o JWE Protected Header (Figure 217) as the authenticated data
- produces the following:
- o Ciphertext from Figure 218.
 - o Authentication Tag from Figure 219.

```

```

Figure 219: Authentication Tag, base64url-encoded

The following is generated after encrypting the Plaintext:

- o JWE Shared Unprotected Header parameters; this example uses the header from Figure 220.

```
{  
  "cty": "text/plain"  
}
```

Figure 220: JWE Shared Unprotected Header JSON

5.13.7. Output Results

The following compose the resulting JWE object:

- o Recipient #1 JSON (Figure 206)
- o Recipient #2 JSON (Figure 210)
- o Recipient #3 JSON (Figure 215)
- o Initialization Vector (Figure 203)
- o Ciphertext (Figure 218)
- o Authentication Tag (Figure 219)

The JWE Compact Serialization is not presented because it does not support this use case; the flattened JWE JSON Serialization is not presented because there is more than one recipient.

The resulting JWE object using the general JWE JSON Serialization:

Figure 221: General JWE JSON Serialization

6. Nesting Signatures and Encryption

This example illustrates nesting a JSON Web Signature (JWS) structure within a JSON Web Encryption (JWE) structure. The signature uses the "PS256" (RSASSA-PSS) algorithm; the encryption uses the "RSA-OAEP" (RSAES-OAEP) key encryption algorithm and the "A128GCM" (AES-GCM) content encryption algorithm.

Note that RSASSA-PSS uses random data to generate the signature, and RSAES-OAEP uses random data to generate the ciphertext; it might not be possible to exactly replicate the results in this section.

Note that whitespace is added for readability as described in [Section 1.1](#).

6.1. Signing Input Factors

The following are supplied before beginning the signing operation:

- o Payload content; this example uses the JSON Web Token [JWT] content from Figure 222, encoded as base64url [RFC4648] to produce Figure 223.
- o RSA private key; this example uses the key from Figure 224.
- o "alg" parameter of "PS256".

```

}
```

Figure 224: RSA 2048-Bit Private Key, in JWK Format

6.2. Signing Operation

The following is generated to complete the signing operation:

- o JWS Protected Header; this example uses the header from Figure 225, encoded using base64url [RFC4648] to produce Figure 226.

```
{
  "alg": "PS256",
  "typ": "JWT"
}
```

Figure 225: JWS Protected Header JSON

eyJhbGciOiJQUzI1NiIsInR5cCI6IkpXVCJ9

Figure 226: JWS Protected Header, base64url-encoded

Performing the signature operation over the combined JWS Protected Header (Figure 226) and payload content (Figure 222) produces the following signature:

dPpMqWRZxFYilUfcDAaf8M99o7kwUwtiXZ-ByvVuJih4MhJ_aZqciprz0OWaIA

QqdCEEkS_rskZS-Qtt_nlegTWhlmEYaA
```

Figure 228: JWS Compact Serialization

6.4. Encryption Input Factors

The following are supplied before beginning the encryption process:

- o Plaintext content; this example uses the content from Figure 228.
- o RSA public key; this example uses the key from Figure 84.
- o "alg" parameter of "RSA-OAEP".
- o "enc" parameter of "A128GCM".

6.5. Encryption Generated Factors

The following are generated before encrypting:

- o AES symmetric key as the Content Encryption Key (CEK); this example uses the key from Figure 229.
- o Initialization Vector; this example uses the Initialization Vector from Figure 230.

```
0RHSNYwN-6-2QBGsYTZLSQ
```

Figure 229: Content Encryption Key, base64url-encoded

```
GbXli9kXz0sxXPmA
```

Figure 230: Initialization Vector, base64url-encoded

6.6. Encrypting the Key

Performing the key encryption operation over the CEK (Figure 229) with the RSA key (Figure 84) produces the following Encrypted Key:

```

```

Figure 233: JWE Protected Header, base64url-encoded

Performing the content encryption operation over the Plaintext (Figure 228) with the following:

- o CEK (Figure 229);
- o Initialization Vector (Figure 230); and
- o JWE Protected Header (Figure 233) as authenticated data

produces the following:

- o Ciphertext from Figure 234.
- o Authentication Tag from Figure 235.

```

7. Security Considerations

This document is designed to provide examples for developers to use in checking their implementations. As such, it does not follow some of the security considerations and recommendations in the core documents (i.e., [JWS], [JWE], [JWK], and [JWA]). For instance:

- o it does not always generate a new CEK value for every encrypted example;
- o it does not always generate a new Initialization Vector (IV) value for every encrypted example; and
- o it does not always generate a new ephemeral key for every ephemeral key example.

For each example, data that is expected to be generated for each signing or encryption operation is isolated to sections titled "Generated Factors".

Acknowledgements

Most of the examples herein use quotes and character names found in the novel "The Fellowship of the Ring" [[LOTR-FELLOWSHIP](#)], written by J. R. R. Tolkien.

Thanks to Richard Barnes, Brian Campbell, Mike Jones, and Jim Schaad for their input and review of the text. Thanks to Brian Campbell for verifying the Compact Serialization examples.
