## Definition of Managed Objects for the Optimized Link State Routing Protocol Version 2

### Abstract

This document defines the Management Information Base (MIB) module for configuring and managing the Optimized Link State Routing Protocol version 2 (OLSRv2). The OLSRv2-MIB module is structured into configuration information, state information, performance information, and notifications. This additional state and performance information is useful for troubleshooting problems and performance issues of the routing protocol. Two levels of compliance allow this MIB module to be deployed on constrained routers.

### Status of This Memo

This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in [Section 2 of RFC 5741](#).

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at <http://www.rfc-editor.org/info/rfc7184>.

## 1. Introduction

This document defines the Management Information Base (MIB) module for configuring and managing the Optimized Link State Routing Protocol version 2 (OLSRv2). The OLSRv2-MIB module is structured into configuration information, state information, performance information, and notifications. In addition to configuration, this additional state and performance information is useful for troubleshooting problems and performance issues of the routing protocol. Different levels of compliance allow implementers to use smaller subsets of all defined objects, allowing for this MIB module to be deployed on more constrained routers.

## 2. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to [Section 7 of \[RFC3410\]](#).

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB module are defined using the mechanisms defined in the Structure of Management Information (SMI). This document specifies a MIB module that is compliant to the SMIV2, which is described in STD 58, [\[RFC2578\]](#), STD 58, [\[RFC2579\]](#) and STD 58 [\[RFC2580\]](#).

## 3. Conventions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [\[RFC2119\]](#).

## 4. Overview

The Optimized Link State Routing Protocol version 2 (OLSRv2) [\[RFC7181\]](#) is a table-driven, proactive routing protocol, i.e., it exchanges topology information with other routers in the network periodically. OLSRv2 is an optimization of the classical link state routing protocol. Its key concept is that of multipoint relays (MPRs). Each router selects a set of its neighbor routers (which "cover" all of its symmetrically connected 2-hop neighbor routers) as MPRs. MPRs are then used to achieve both flooding reduction and topology reduction.

This document provides management and control capabilities of an OLSRv2 instance, allowing management applications to monitor the state and performance of an OLSRv2 router, as well as to change settings of the OLSRv2 instance (e.g., router or interface parameters such as message intervals, etc.).

As OLSRv2 relies on the neighborhood information discovered by the "Mobile Ad Hoc Network (MANET) Neighborhood Discovery Protocol (NHDP)" [\[RFC6130\]](#), the OLSRv2-MIB module is aligned with the NHDP-MIB module [\[RFC6779\]](#) and augments several of the tables and objects in the NHDP-MIB. In particular, common indexes for router interfaces and discovered neighbors are used, as described in [Section 5.2](#).

#### 4.1. Terms

The following definitions apply throughout this document:

- o Configuration Objects - switches, tables, and objects that are initialized to default settings or set through the management interface defined by this MIB module.
- o State Objects - automatically generated values that define the current operating state of the OLSRv2 protocol instance in the router.
- o Performance Objects - automatically generated values that help an administrator or automated tool to assess the performance of the OLSRv2 process on the router.
- o Notification Objects - objects that define triggers and associated notification messages allowing for asynchronous tracking of predefined events on the managed router.

#### 5. Structure of the MIB Module

This section presents the structure of the OLSRv2-MIB module. The objects are arranged into the following structure:

- o `olsrv2MIBObjects` - defines objects forming the basis for the OLSRv2-MIB module. These objects are divided up by function into the following groups:
  - \* Configuration Group - defining objects related to the configuration of the OLSRv2 instance on the router.
  - \* State Group - defining objects that reflect the current state of the OLSRv2 instance running on the router.
  - \* Performance Group - defining objects that are useful to a management system when characterizing the performance of OLSRv2 on the router and in the MANET.
- o `olsrv2MIBNotifications` - objects defining OLSRv2-MIB module notifications.
- o `olsrv2MIBConformance` - defining the minimal and maximal conformance requirements for implementations of this MIB module.

### 5.1. The Configuration Group

The OLSRv2 router is configured with a set of controls. The authoritative list of configuration controls within the OLSRv2-MIB module is found within the MIB module itself. Generally, an attempt was made in developing the OLSRv2-MIB module to support all configuration objects defined in [RFC7181]. For all of the configuration parameters, the same constraints and default values of these parameters as defined in [RFC7181] are followed.

### 5.2. The State Group

The State Group reports current state information of a router running [RFC7181]. The OLSRv2-MIB module State Group tables were designed to contain the complete set of state information defined within the Information Bases in [RFC7181].

The OLSRv2-MIB module State Group tables are constructed as extensions to the corresponding tables within the State Group of the NHDP-MIB module [RFC6779]. Use of the AUGMENTS clause is made, when possible, to accomplish these table extensions. Further, the State Group tables defined in this MIB module are aligned with the corresponding tables in the NHDP-MIB module [RFC6779], as described in Section 6.2.

### 5.3. The Performance Group

The Performance Group reports values relevant to system performance. Frequent changes of sets or frequent recalculation of the Routing Set or the MPRs can have a negative influence on the performance of OLSRv2. This MIB module defines several objects that can be polled, e.g., in order to calculate histories or monitor frequencies of changes. This may help the network administrator to determine unusual topology changes or other changes that affect stability and reliability of the MANET. One such framework is specified in REPORT-MIB [REPORT-MIB].

### 5.4. The Notifications Group

The Notifications Group contains Control (olsrv2NotificationsControl), Objects (olsrv2NotificationsObjects), and States (olsrv2NotificationsStates), where the Control contains definitions of objects to control the frequency of notifications being generated. The Objects define the supported notifications, and the State is used to define additional information to be carried within the notifications.

The `olsrv2NotificationsObjects` sub-tree contains the list of notifications supported within the OLSRv2-MIB module and their intended purpose or utility.

The same mechanisms for improving the network performance by reducing the number of notifications apply as defined in [Section 5.1 of \[RFC6779\]](#). The following objects are used to define the thresholds and time windows for specific notifications defined in the NHDP-MIB module: `olsrv2RoutingSetRecalculationCountThreshold`, `olsrv2RoutingSetRecalculationCountWindow`, `olsrv2MPRSetRecalculationCountThreshold`, and `olsrv2MPRSetRecalculationCountWindow`.

### 5.5. Tables and Indexing

The OLSRv2-MIB module's tables are indexed by the following constructs:

- o `nhdpIfIndex` - the `ifIndex` of the local router on which NHDP is configured. This is defined in the NHDP-MIB.
- o `nhdpDiscIfIndex` - a locally managed index representing a known interface on a neighboring router. This is defined in the NHDP-MIB.
- o `nhdpDiscRouterIndex` - a locally managed index representing an ID of a known neighboring router. This is defined in the NHDP-MIB.
- o `{olsrv2LibOrigSetIpAddrType, olsrv2LibOrigSetIpAddr}` - this index (pair) uniquely identifies recently used originator addresses found within the `olsrv2LibOrigSetTable`.
- o `{olsrv2LibLocAttNetSetIpAddrType, olsrv2LibLocAttNetSetIpAddr, olsrv2LibLocAttNetSetIpAddrPrefixLen}` - this index (triplet) uniquely identifies local attached networks reachable through local (non-OLSRv2) interfaces on this router. These are recorded in the `olsrv2LibLocAttNetSetTable`.
- o `{olsrv2TibAdRemoteRouterSetIpAddrType, olsrv2TibAdRemoteRouterSetIpAddr}` - this index (pair) uniquely identifies each router in the network that transmits Topology Control (TC) messages received by this router. These records are recorded in the `olsrv2TibAdRemoteRouterSetIpAddr`.
- o `{olsrv2TibRouterTopologySetFromOrigIpAddrType, olsrv2TibRouterTopologySetFromOrigIpAddr, olsrv2TibRouterTopologySetToOrigIpAddrType, olsrv2TibRouterTopologySetToOrigIpAddr}` - this index (quadruplet)

uniquely identifies discovered links within the network recorded by this router. Information associated with each link is stored in the `olsrv2TibRouterTopologySetTable`.

- o {`olsrv2TibRoutableAddressTopologySetFromOrigIpAddressType`, `olsrv2TibRoutableAddressTopologySetFromOrigIpAddress`, `olsrv2TibRoutableAddressTopologySetFromDestIpAddressType`, `olsrv2TibRoutableAddressTopologySetFromDestIpAddress`} - this index (quadruplet) uniquely identifies reachable addresses within the network and the router's advertising of these addresses. This information is stored in the `olsrv2TibRoutableAddressTopologySetTable`.
- o {`olsrv2TibAttNetworksSetOrigIpAddressType`, `olsrv2TibAttNetworksSetOrigIpAddress`, `olsrv2TibAttNetworksSetNetIpAddressType`, `olsrv2TibAttNetworksSetNetIpAddress`, `olsrv2TibAttNetworksSetNetIpAddressPrefixLen`} - this index (quintuplet) uniquely identifies the networks (which may be outside the MANET) and the routers through which these networks can be reached. This information is stored in the `olsrv2TibAttNetworksSetTable`.
- o {`olsrv2TibRoutingSetDestIpAddressType`, `olsrv2TibRoutingSetDestIpAddress`, `olsrv2TibRoutingSetDestIpAddressPrefixLen`} - this index (triplet) uniquely identifies the address of a reachable destination in the network. This indexes the `olsrv2TibRoutingSetTable`, which contains the next-hop information to reach the indexed addresses.

These tables and their indexing are:

- o `olsrv2InterfaceTable` - describes the OLSRv2 status on the NHDP interfaces of this router. This table augments `nhdpInterfaceEntry` and, as such, it is indexed by the {`nhdpIfIndex`} from the NHDP-MIB.
- o `olsrv2IibLinkSetTable` - records all links from other routers that are, or recently were, 1-hop neighbors. This table augments `nhdpIibLinkSetEntry` and, as such, it is indexed by `nhdpIfIndex` and `nhdpDiscIfIndex`.
- o `olsrv2Iib2HopSetTable` - records network addresses of symmetric 2-hop neighbors and the links to the associated 1-hop neighbors. This table augments `nhdpIib2HopSetEntry` and, as such, it is indexed by {`nhdpIfIndex`, `nhdpDiscIfIndex`, `nhdpIib2HopSetIpAddressType`, `nhdpIib2HopSetIpAddress`}.

- o `olsrv2LibOrigSetTable` - records addresses that were recently used as originator addresses by this router. This table is indexed by `{olsrv2LibOrigSetIpAddressType, olsrv2LibOrigSetIpAddress}`.
- o `olsrv2LibLocAttNetSetTable` - records its local non-OLSRv2 interfaces via which it can act as a gateway to other networks. This table is indexed by `{olsrv2LibLocAttNetSetIpAddressType, olsrv2LibLocAttNetSetIpAddress, olsrv2LibLocAttNetSetIpAddressPrefixLen}`.
- o `olsrv2NibNeighborSetTable` - records all network addresses of each 1-hop neighbor. This table augments `nhdpNibNeighborSetEntry` and, as such, it is indexed by the `{nhdpDiscRouterIndex}`.
- o `olsrv2TibAdRemoteRouterSetTable` - records information describing each remote router in the network that transmits TC messages. This table is indexed by `{olsrv2TibAdRemoteRouterSetIpAddressType, olsrv2TibAdRemoteRouterSetIpAddress}`.
- o `olsrv2TibRouterTopologySetTable` - records topology information about the network. This table is indexed by `{olsrv2TibRouterTopologySetFromOrigIpAddressType, olsrv2TibRouterTopologySetFromOrigIpAddress, olsrv2TibRouterTopologySetToOrigIpAddressType, olsrv2TibRouterTopologySetToOrigIpAddress}`.
- o `olsrv2TibRoutableAddressTopologySetTable` - records topology information about the routable addresses within the MANET and via which routers they may be reached. This table is indexed by `{olsrv2TibRoutableAddressTopologySetFromOrigIpAddressType, olsrv2TibRoutableAddressTopologySetFromOrigIpAddress, olsrv2TibRoutableAddressTopologySetFromDestIpAddressType, olsrv2TibRoutableAddressTopologySetFromDestIpAddress}`.
- o `olsrv2TibAttNetworksSetTable` - records information about networks (which may be outside the MANET) attached to other routers and their routable addresses. This table is indexed by `{olsrv2TibAttNetworksSetOrigIpAddressType, olsrv2TibAttNetworksSetOrigIpAddress, olsrv2TibAttNetworksSetNetIpAddressType, olsrv2TibAttNetworksSetNetIpAddress, olsrv2TibAttNetworksSetNetIpAddressPrefixLen}`.
- o `olsrv2TibRoutingSetTable` - records the first hop along a selected path to each destination for which any such path is known. This table is indexed by `{olsrv2TibRoutingSetDestIpAddressType, olsrv2TibRoutingSetDestIpAddress, olsrv2TibRoutingSetDestIpAddressPrefixLen}`.

- o `olsrv2InterfacePerfTable` - records performance counters for each active OLSRv2 interface on this device. This table augments `nhdpInterfacePerfEntry` and, as such, it is indexed by `{nhdpIfIndex}` from the NHDP-MIB.

## 6. Relationship to Other MIB Modules

This section specifies the relationship of the MIB modules contained in this document to other standards, particularly to standards containing other MIB modules. MIB modules and specific definitions imported from MIB modules that SHOULD be implemented in conjunction with the MIB module contained within this document are identified in this section.

### 6.1. Relationship to the SNMPv2-MIB

The System group in the SNMPv2-MIB module [RFC3418] is defined as being mandatory for all systems, and the objects apply to the entity as a whole. The System group provides identification of the management entity and certain other system-wide data. The OLSRv2-MIB module does not duplicate those objects.

### 6.2. Relationship to the NHDP-MIB

OLSRv2 depends on the neighborhood information that is discovered by [RFC6130]. An instance of OLSRv2 MUST have an associated instance of NHDP running on the same device for proper operations of the discovery and routing system. In order for the OLSRv2-MIB module to correctly populate the objects relating to discovered neighbors, the State Group tables of the NHDP-MIB module [RFC6779] are aligned with the State Group tables of this MIB module. This is accomplished through the use of the AUGMENTS capability of SMIV2 (where appropriate). This will allow for cross referencing of information between the two MIB modules within a given SNMP context.

### 6.3. MIB Modules Required for IMPORTS

The following OLSRv2-MIB module IMPORTS objects from NHDP-MIB [RFC6779], SNMPv2-SMI [RFC2578], SNMPv2-TC [RFC2579], SNMPv2-CONF [RFC2580], IF-MIB [RFC2863], and INET-ADDRESS-MIB [RFC4001]. The OLSRv2-MIB module also IMPORTS objects from the IANAolsrv2LinkMetricType-MIB, which is available at <<http://www.iana.org/assignments/ianaolsrv2linkmetrictype-mib>>.

## 7. Definitions

This section contains the OLSRv2-MIB module defined by the specification.

```
    DESCRIPTION
```

"OLSRv2 Metrics are expressed in terms of a Link Metric Compressed Form within the OLSRv2 protocol. This textual convention defines the syntax of the metric objects consistent with the definitions of the OLSRv2 Link Metric Compressed Form in [Section 6.2 of RFC 7181](#).

The 12-bit compressed form of a link metric uses a modified form of a representation with an 8-bit mantissa (denoted a) and a 4-bit exponent (denoted b). Note that if represented as the 12-bit value  $256b+a$ , then the ordering of those 12-bit values is identical to the ordering of the represented values.

The value so represented is  $(257+a)2^b - 256$ , where  $^$  denotes exponentiation. This has a minimum value (when  $a = 0$  and  $b = 0$ ) of `MINIMUM_METRIC` = 1 and a maximum value (when  $a = 255$  and  $b = 15$ ) of `MAXIMUM_METRIC` =  $2^{24} - 256$ .

Hence, the metric values so represented range from 1 to 16776960. The special value of 0 is reserved for the `UNKNOWN_METRIC` value.

If a network manager sets the metric value 'm' through the MIB module, then the OLSRv2 code can both use this value and derive a compressed representation of 'm' (as used in messages) as specified in [Section 6.2 of RFC7181](#). The value 'm' is persistently stored by the MIB module. If the MIB module is pulling this metric's value from some other source, e.g., the protocol instance, then this value is stored as is."

```
SYNTAX  Unsigned32 (0..16776960)
```

```
Olsrv2TimeValueCompressedForm32TC ::= TEXTUAL-CONVENTION
```

```
    DISPLAY-HINT "x"
```

```
    STATUS      current
```

```
    DESCRIPTION
```

"OLSRv2 time values may be expressed in terms of a compressed form within the OLSRv2 protocol. This textual convention defines the syntax of the time objects defined in terms of an integer number of milliseconds, consistent with the definitions of the 8-bit exponent-mantissa compressed form

defined in [Section 5 of RFC 5497](#). Time values with this representation are defined in terms of a constant C, which is represented in terms of seconds. The constant C (time granularity) is used as specified in [RFC 5497](#). It MUST be the same as is used by NHDP ([RFC 6130](#)).

The 8-bit compressed form of a time value uses a modified form of a representation with a 3-bit mantissa (denoted a) and a 5-bit exponent (denoted b). Note that if represented as the 8-bit value  $8b+a$ , then the ordering of those 8-bit values is identical to the ordering of the represented values.

The minimum time value that can be represented in this manner is C. The maximum time value that can be represented in this manner is  $15 * 2^{28} * C$ ,  $15 * 268,435,456 * C$ ,  $4,026,531,840 * C$ , or about 45 days if, for example,  $C = 1/1024$  second.

This TEXTUAL-CONVENTION limits the maximum value of the time granularity constant C to be no greater than 1/1024 seconds due to its use of the Unsigned32 syntax limiting the maximum number of milliseconds to no more than 3932160000.

When OLSRv2 uses this 8-bit exponent-mantissa compressed form, this object value MUST be translated from the integer form represented in this MIB module into the exponent-mantissa form for the OLSRv2 protocol to use according to the algorithm defined in [Section 5 of RFC 5497](#) for finding the next larger time value within the exponent-mantissa format.

If a network manager sets the time value 't' through the MIB module, then the OLSRv2 code can derive 'compressed\_t' = T(a,b) according to the algorithm in [RFC 5497](#) and 'compressed\_t' is the value represented in the OLSRv2 messages. But, the value 't' is persistently stored by the MIB module. If the MIB module is pulling this time parameter from some other source that is using the compressed form, i.e., the protocol instance, then this value is stored as is, after converting from number of time constants C into number of milliseconds."

STATUS current

## DESCRIPTION

"The configured status of the OLSRv2 process on this device. 'enabled(1)' means that OLSRv2 is configured to run on this device. 'disabled(2)' mean that the OLSRv2 process is configured off.

Operation of the OLSRv2 protocol requires the operation of the Neighborhood Discovery Protocol ([RFC 6130](#)). Hence, this object cannot have a status of 'enabled' unless at least one interface on the device is a MANET interface with NHDP enabled on that interface. If a network manager attempts to set this object to 'enabled' when no interfaces on this device have NHDP enabled, the device MUST fail the set with inconsistentValue. If all device interfaces running NHDP become disabled or removed, then the olsrv2AdminStatus MUST be 'disabled'.

If the network manager, or other means, sets this object to 'disabled', then the associated interface specific objects, i.e., the olsrv2InterfaceAdminStatus objects MUST all be 'disabled'.

This object is persistent, and when written, the entity SHOULD save the change to non-volatile storage."

```
DEFVAL { disabled }

```

## olsrv2InterfaceTable OBJECT-TYPE

```
SYNTAX      SEQUENCE OF Olsrv2InterfaceEntry
MAX-ACCESS  not-accessible
STATUS      current
```

## DESCRIPTION

"The olsrv2InterfaceTable describes the OLSRv2 status on the NHDP interfaces of this router. As such, this table augments the nhdpInterfaceTable defined in the NHDP-MIB ([RFC 6779](#)). NHDP interfaces are explicitly defined by network management, command line interface (CLI) or other means for interfaces on the device that are intended to run MANET protocols. The olsrv2InterfaceTable contains a single object: the olsrv2InterfaceAdminStatus object. This object is set by network management, or by

other means, e.g., CLI.

A conceptual row in this table exists if and only if a corresponding entry in the nhdpInterfaceTable exists. If the corresponding entry with nhdpIfIndex value is deleted from the nhdpInterfaceTable, then the entry in this table is automatically deleted and OLSRv2 is disabled on this interface, and all configuration and state information related to this interface is to be removed from memory.

The olsrv2InterfaceAdminStatus can only be 'enabled' if the corresponding olsrv2AdminStatus object is also set to 'enabled'."

#### DESCRIPTION

"The olsrv2InterfaceEntry describes one OLSRv2 local interface configuration as indexed by its nhdpIfIndex, as defined in the NHDP-MIB ([RFC 6779](#))."

The objects in this table are persistent, and when written, the device SHOULD save the change to non-volatile storage. For further information on the storage behavior for these objects, refer to the description for the nhdpIfRowStatus object in the NHDP-MIB ([RFC6779](#))."

 STATUS         current  
 DESCRIPTION

"olsrv2Iib2HopSetOutMetricValue is the neighbor metric to the router with address N2\_2hop\_iface\_addr from the router with OLSRv2 interface addresses N2\_neighbor\_iface\_addr\_list.

The N2\_2hop\_iface\_addr is identified by the (nhdpIib2HopSetIpAddressType, nhdpIib2HopSetIpAddress) pair from the nhdpIibLinkSetTable, which this table augments.

The N2\_neighbor\_iface\_addr\_list is defined by the nhdpDiscIfIndex, which is an index of the nhdpIibLinkSetTable, which this table augments."

 STATUS           current  
 DESCRIPTION  
   "olsrv2LibOrigSetExpireTime specifies the value  
   of sysUptime when this entry SHOULD expire and be  
   removed from the olsrv2LibOrigSetTable. This time  
   is determined at the time the entry is added,  
   derived from the following expression:

$$O\_time := \text{current time} + O\_HOLD\_TIME$$

where O\_time is olsrv2LibOrigSetExpireTime,  
 current\_time is current sysUptime, and  
 O\_HOLD\_TIME is a parameter of the OLSRv2  
 protocol. In the event that the  
 O\_HOLD\_TIME is changed, the  
 olsrv2LibOrigSetExpireTime needs to be  
 recomputed for each of the entries in this table."

 MAX-ACCESS      not-accessible  
 STATUS           current

## DESCRIPTION

"The entries include the Local Attached Network Tuples:

```
(AL_net_addr (olsrv2LibLocAttNetSetIpAddress),  
  AL_dist (olsrv2LibLocAttNetSetDistance),  
  AL_metric (olsrv2LibLocAttNetSetMetricValue)  
)
```

where:

AL\_net\_addr is the network address of an attached network that can be reached via this router. The AL\_net\_addr is defined in this MIB module by the tuple (olsrv2LibLocAttNetSetIpAddressType, olsrv2LibLocAttNetSetIpAddress, olsrv2LibLocAttNetSetIpAddressPrefixLen).

AL\_dist is the number of hops to the network with address AL\_net\_addr from this router. The AL\_dist is defined in this MIB module by the olsrv2LibLocAttNetSetDistance object.

AL\_metric is the metric of the link to the attached network with address AL\_net\_addr from this router. The AL\_metric is defined in this MIB module by the olsrv2LibLocAttNetSetMetricValue object.

OLSRv2 ([RFC 7181](#)) defines the rules for managing entries within this table, e.g., populating and purging entries. Specific instructions for the olsrv2LibLocAttNetSetEntry(s) are found in Sections 7.2 and 17 of OLSRv2 ([RFC 7181](#))."

olsrv2TibAdRemoteRouterSetMaxSeqNo OBJECT-TYPE
    SYNTAX      Unsigned32 (0..65535)
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
        "This is the greatest Advertised Neighbor Sequence
        Number (ANSN) in any TC message
        received that originated from the router
        with originator address
        olsrv2TibAdRemoteRouterSetIpAddress.

```

Sequence numbers are used in the OLSRv2 protocol for the purpose of discarding 'old' information, i.e., messages received out of order. However, with a limited number of bits for representing sequence numbers, wraparound (that the sequence number is incremented from the maximum possible value to zero) will occur. To prevent this from interfering with the operation of this protocol, OLSRv2 implementations observe the following when determining the ordering of sequence numbers.

In OLSRv2, MAXVALUE designates one more than the largest possible value for a sequence number. For a 16-bit sequence number, MAXVALUE is 65536.

The sequence number S1 is said to be 'greater than' the sequence number S2 if:

- o S1 > S2 AND S1 - S2 < MAXVALUE/2 OR
- o S2 > S1 AND S2 - S1 > MAXVALUE/2

When sequence numbers S1 and S2 differ by MAXVALUE/2, their ordering cannot be determined. In this case,

which should not occur, either ordering may be assumed.

Thus, when comparing two messages, it is possible - even in the presence of wraparound - to determine which message contains the most recent information."

## DESCRIPTION

"This is the greatest Advertised Neighbor Sequence Number (ANSN) in any TC message received that originated from the router with originator address TR\_from\_orig\_addr, i.e., that contributed to the information contained in this Tuple and that is defined by the objects:

(olsrv2TibRouterTopologySetFromOrigIpAddressType, olsrv2TibRouterTopologySetFromOrigIpAddress).

Sequence numbers are used in the OLSRv2 protocol for the purpose of discarding 'old' information, i.e., messages received out of order. However, with a limited number of bits for representing sequence numbers, wraparound (that the sequence number is incremented from the maximum possible value to zero) will occur. To prevent this from interfering with the operation of this protocol, OLSRv2 implementations observe the following when determining the ordering of sequence numbers.

In OLSRv2, MAXVALUE designates one more than the largest possible value for a sequence number. For a 16-bit sequence number, MAXVALUE is 65536.

The sequence number S1 is said to be 'greater than' the sequence number S2 if:

- o S1 > S2 AND S1 - S2 < MAXVALUE/2 OR
- o S2 > S1 AND S2 - S1 > MAXVALUE/2

When sequence numbers S1 and S2 differ by MAXVALUE/2,

their ordering cannot be determined. In this case, which should not occur, either ordering may be assumed.

Thus, when comparing two messages, it is possible - even in the presence of wraparound - to determine which message contains the most recent information."

::= { olsrv2TibAttNetworksSetEntry 5 }

olsrv2TibAttNetworksSetSeqNo OBJECT-TYPE

SYNTAX Unsigned32 (0..65535)

MAX-ACCESS read-only

STATUS current

## DESCRIPTION

"This is the greatest Advertised Neighbor Sequence Number (ANSN) in any TC message received that originated from the router with originator address AN\_orig\_addr (i.e., that contributed to the information contained in this Tuple). The AN\_orig\_addr is defined by the tuple (olsrv2TibAttNetworksSetOrigIpAddressType, olsrv2TibAttNetworksSetOrigIpAddress).

Sequence numbers are used in the OLSRv2 protocol for the purpose of discarding 'old' information, i.e., messages received out of order. However, with a limited number of bits for representing sequence numbers, wraparound (that the sequence number is incremented from the maximum possible value to zero) will occur. To prevent this from interfering with the operation of this protocol, the following MUST be observed when determining the ordering of sequence numbers.

The term MAXVALUE designates in the following one more than the largest possible value for a sequence number. For a 16-bit sequence number (as are those defined in this specification), MAXVALUE is 65536.

The sequence number S1 is said to be 'greater than' the sequence number S2 if:

- o S1 > S2 AND S1 - S2 < MAXVALUE/2 OR
- o S2 > S1 AND S2 - S1 > MAXVALUE/2

When sequence numbers S1 and S2 differ by MAXVALUE/2, their ordering cannot be determined. In this case, which should not occur, either ordering may be assumed.

Thus, when comparing two messages, it is possible - even in the presence of wraparound - to determine which message contains the most recent information."

## 8. Security Considerations

This MIB module defines objects for the configuration, monitoring, and notification of the Optimized Link State Routing Protocol version 2 (OLSRv2) [RFC7181]. OLSRv2 allows routers to acquire topological information of the routing domain by exchanging TC messages in order to calculate shortest paths to each destination router in the routing domain.

There are a number of management objects defined in this MIB module with a MAX-ACCESS clause of read-write and/or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure

environment without proper protection can have a negative effect on network operations. These are the tables and objects and their sensitivity/vulnerability:

- o `olsrv2TcInterval`, `olsrv2TcMinInterval` - these writable objects control the rate at which TC messages are sent. If set at too high a rate, this could represent a form of a DoS attack by overloading interface resources. If set too low, OLSRv2 may not converge fast enough to provide accurate routes to all destinations in the routing domain.
- o `olsrv2TcHopLimit` - defines the hop limit for TC messages. If set too low, messages will not be forwarded beyond the defined scope; thus, routers further away from the message originator will not be able to construct appropriate topology graphs.
- o `olsrv2OHoldTime`, `olsrv2THoldTime`, `olsrv2AHoldTime`, `olsrv2RxHoldTime`, `olsrv2PHoldTime`, `olsrv2FHoldTime` - define hold times for tuples of different Information Bases of OLSRv2. If set too low, information will expire quickly, and may this harm a correct operation of the routing protocol.
- o `olsrv2WillFlooding` and `olsrv2WillRouting` - define the willingness of this router to become MPR. If this is set to `WILL_NEVER` (0), the managed router will not forward any TC messages, nor accept a selection to become MPR by neighboring routers. If set to `WILL_ALWAYS` (15), the router will be preferred by neighbors during MPR selection and may thus attract more traffic.
- o `olsrv2TpMaxJitter`, `olsrv2TtMaxJitter`, `olsrv2FMaxJitter` - define jitter values for TC message transmission and forwarding. If set too low, control traffic may get lost when collisions occur.
- o `olsrv2LinkMetricType` - defines the type of the link metric that a router uses (e.g., ETX or hop count). Whenever this value changes, all link metric information recorded by the router is invalid, causing a reset of information acquired from other routers in the MANET. Moreover, if `olsrv2LinkMetricType` on a router is set to a value that is not known to other routers in the MANET, these routers will not be able to establish routes to that router or transiting that router. Existing routes to the router with an `olsrv2LinkMetricType` unknown to other routers in the MANET will be removed.

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET and/or NOTIFY access to these objects and possibly

to even encrypt the values of these objects when sending them over the network via SNMP. These are the tables and objects and their sensitivity/vulnerability:

- o `olsrv2TibRouterTopologySetTable` - The contains information on the topology of the MANET, specifically the IP address of the routers in the MANET (as identified by `olsrv2TibRouterTopologySetFromOrigIpAddress` and `olsrv2TibRouterTopologySetToOrigIpAddress` objects). This information provides an adversary broad information on the members of the MANET, located within this single table. This information can be used to expedite attacks on the other members of the MANET without having to go through a laborious discovery process on their own.

Some of the Tables in this MIB module AUGMENT Tables defined in NHDP-MIB [RFC6779]. Hence, care must be taken in configuring access control here in order make sure that the permitted permissions granted for the AUGMENTing Tables here are consistent with the access controls permitted within the NHDP-MIB. The below list identifies the AUGMENTing Tables and their NHDP-MIB counterparts. It is RECOMMENDED that access control policies for these Table pairs are consistently set.

- o The `olsrv2InterfaceTable` AUGMENTS the `nhdpInterfaceTable`.
- o The `olsrv2IibLinkSetTable` AUGMENTS the `nhdpIibLinkSetTable`.
- o The `olsrv2Iib2HopSetTable` AUGMENTS the `nhdpIib2HopSetTable`.
- o The `olsrv2NibNeighborSetTable` AUGMENTS the `nhdpNibNeighborSetTable`.
- o The `olsrv2InterfacePerfTable` AUGMENTS the `nhdpInterfacePerfTable`.

MANET technology is often deployed to support communications of emergency services or military tactical applications. In these applications, it is imperative to maintain the proper operation of the communications network and to protect sensitive information related to its operation. Therefore, when implementing these capabilities, the full use of SNMPv3 cryptographic mechanisms for authentication and privacy is RECOMMENDED.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPsec), there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

Implementations SHOULD provide the security features described by the SNMPv3 framework (see [RFC3410]), and implementations claiming compliance to the SNMPv3 standard MUST include full support for authentication and privacy via the User-based Security Model (USM) [RFC3414] with the AES cipher algorithm [RFC3826]. Implementations MAY also provide support for the Transport Security Model (TSM) [RFC5591] in combination with a secure transport such as SSH [RFC5592] or TLS/DTLS [RFC6353].

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

## 9. Applicability Statement

This document describes objects for configuring parameters of the Optimized Link State Routing Protocol version 2 (OLSRv2) [RFC7181] process on a router. This MIB module, denoted OLSRv2-MIB, also reports state, performance information, and notifications. The OLSRv2 protocol relies upon information gathered via the Neighborhood Discovery Protocol [RFC6130] in order to perform its operations. NHDP is managed via the NHDP-MIB [RFC6779].

MANET deployments can greatly differ in aspects of dynamics of the topology, capacity, and loss rates of underlying channels, traffic flow directions, memory and CPU capacity of routers, etc. SNMP, and therefore this MIB module, are only applicable for a subset of MANET deployments, in particular deployments:

- o In which routers have enough memory and CPU resources to run SNMP and expose the MIB module.
- o Where a Network Management System (NMS) is defined to which notifications are generated and from which routers can be managed.
- o Where this NMS is reachable from routers in the MANET most of the time (as notifications to the NMS and management information from the NMS to the router will be lost when connectivity is temporarily lost). This requires that the topology of the MANET is only moderately dynamic.
- o Where the underlying wireless channel supports enough bandwidth to run SNMP, and where loss rates of the channel are not exhaustive.

Certain MANET deployments such as community networks with non-mobile routers, dynamic topology because of changing link quality, and a predefined gateway (that could also serve as NMS), are examples of networks applicable for this MIB module. Other, more constrained deployments of MANETs may not be able to run SNMP and require different management protocols.

Some level of configuration, i.e., read-write objects, is desirable for OLSRv2 deployments. Topology-related configuration, such as the ability to enable OLSRv2 on new interfaces or initially configure OLSRv2 on a router's interfaces through the `olsrv2InterfaceAdminStatus` object, is critical to initial system startup. The OLSRv2 protocol allows for some level of performance tuning through various protocol parameters, and this MIB module allows for configuration of those protocol parameters through read-write objects such as the `olsrv2TcHopLimit` or the `olsrv2FMaxJitter`. Other read-write objects allow for the control of Notification behavior through this MIB module, e.g., the `olsrv2RoutingSetRecalculationCountThreshold` object. A fuller discussion of MANET network management applicability is to be provided elsewhere: [MGMT-SNAP] provides a snapshot of OLSRv2-routed MANET management as currently deployed, while [MANET-MGMT] is intended to provide specific guidelines on MANET network management considering the various MIB modules that have been written.

## 10. IANA Considerations

IANA now maintains the `IANAolsrv2LinkMetricType-MIB` and keeps it synchronized with the "LINK\_METRIC Address Block TLV Type Extensions" registry at <http://www.iana.org/assignments/manet-parameters>.

The MIB modules in this document use the following IANA-assigned OBJECT IDENTIFIER values recorded in the SMI Numbers registry:

Descriptor	OBJECT IDENTIFIER value
-----	-----
OLSRv2-MIB	{ mib-2 219 }
IANA-OLSRv2-LINK-METRIC-TYPE-MIB	{ mib-2 221 }

## 11. Acknowledgements

The authors would like to thank Randy Presuhn, Benoit Claise, Adrian Farrel, as well as the entire MANET WG for reviews of this document.

This MIB document uses the template authored by D. Harrington, which is based on contributions from the MIB Doctors, especially Juergen Schoenwaelder, Dave Perkins, C.M. Heard, and Randy Presuhn.

IANAolsrv2LinkMetricTypeTC ::= TEXTUAL-CONVENTION

STATUS current

DESCRIPTION

"This data type is used as the syntax of the  
olsrv2LinkMetricType object in the definition  
of the OLSRv2-MIB module.

The olsrv2LinkMetricType corresponds to

LINK\_METRIC\_TYPE of OLSRv2 (RFC 7181).  
OLSRv2 uses bidirectional additive link metrics  
to determine shortest distance routes (i.e.,  
routes with smallest total of link metric values).

OLSRv2 has established a registry for the LINK\_METRIC\_TYPES  
(denoted 'LINK\_METRIC Address Block TLV Type Extensions'):  
<http://www.iana.org/assignments/manet-parameters/>

This is done in Section 24.5 in OLSRv2 (RFC 7181).  
The LINK\_METRIC\_TYPE (which has as corresponding  
object in the MIB module olsrv2LinkMetricType)  
corresponds to the type extension of  
the LINK\_METRIC TLV that is set up in the  
'LINK\_METRIC Address Block TLV Type Extensions' registry.  
Whenever new link metric types are added to that registry,  
IANA MUST update this textual convention accordingly.

The definition of this textual convention with the  
addition of newly assigned values is published  
periodically by the IANA, in either the Assigned  
Numbers RFC, or some derivative of it specific to  
Internet Network Management number assignments. (The  
latest arrangements can be obtained by contacting the  
IANA.)

Requests for new values should be made to IANA via  
email (iana@iana.org)."
