

Definition of an IS-IS Link Attribute Sub-TLV

Status of This Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

This document defines a sub-TLV called "Link-attributes" carried within the TLV 22 and used to flood some link characteristics.

Table of Contents

6. Acknowledgements	3
7. References	4
7.1. Normative References	4
7.2. Informative References	4

1. Introduction

[IS-IS] specifies the IS-IS protocol (ISO 10589) with extensions to support IPv4 in [RFC1195]. A router advertises one or several Link State Protocol data units that are composed of variable length tuples called TLVs (Type-Length-Value).

[RFC3784] defines a set of new TLVs whose aims are to add more information about links characteristics, increase the range of IS-IS metrics, and optimize the encoding of IS-IS prefixes.

This document defines a new sub-TLV named "Link-attributes" carried within the extended IS reachability TLV (type 22) specified in [RFC3784].

1.1 Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

2. Link-Attributes Sub-TLV Format

The link-attribute sub-TLV is carried within the TLV 22 and has a format identical to the sub-TLV format used by the Traffic Engineering Extensions for IS-IS ([RFC3784]): 1 octet of sub-type, 1 octet of length of the value field of the sub-TLV followed by the value field -- in this case, a 16 bit flags field.

The Link-attribute sub-type is 19 and the link-attribute has a length of 2 octets.

This sub-TLV is OPTIONAL and MUST appear at most once for a single IS neighbor. If a received Link State Packet (LSP) contains more than one Link-Attribute Sub-TLV, an implementation SHOULD decide to consider only the first encountered instance.

The following bits are defined:

Local Protection Available (0x01). When set, this indicates that the link is protected by means of some local protection mechanism (e.g., [RFC4090]).

Link excluded from local protection path (0x02). When set, this link SHOULD not be included in any computation of a repair path by any other router in the routing area. The triggers for setting up this bit are out of the scope of this document.

3. Interoperability with Routers Not Supporting This Capability

A router not supporting the link-attribute sub-TLV will just silently ignore this sub-TLV.

4. IANA Considerations

IANA has assigned codepoint 19 for the link-attribute sub-TLV defined in this document and carried within TLV 22.

IANA has created a registry for bit values inside the link-attributes sub-TLV. The initial contents of this registry are as follows

Value	Name	Reference
-----	----	-----
0x1	Local Protection Available	[RFC5029]
0x2	Link Excluded from Local Protection	[RFC5029]

Further values are to be allocated by the Standards Action process defined in [RFC2434], with Early Allocation (defined in [RFC4020]) permitted.

5. Security Considerations

Any new security issues raised by the procedures in this document depend upon the opportunity for LSPs to be snooped and modified, the ease/difficulty of which has not been altered. As the LSPs may now contain additional information regarding router capabilities, this new information would also become available to an attacker. Specifications based on this mechanism need to describe the security considerations around the disclosure and modification of their information. Note that an integrity mechanism, such as one defined in [RFC3567], should be applied if there is high risk resulting from the modification of capability information.

6. Acknowledgements

The authors would like to thank Mike Shand, Les Ginsberg, and Bill Fenner for their useful comments.
