Abstract

This memo defines an extension to the Atom Syndication Format for describing licenses associated with Atom feeds and entries.

1. Introduction

This document defines an extension to the Atom Syndication Format that can be used to add links to Atom feed or entry documents referencing resources that describe the explicit rights that have been granted to consumers of those documents.

Describing licenses using the mechanisms defined in this specification is currently considered to be largely experimental. While it is a common practice for feed publishers to associate licenses with syndicated content, there are still very few feed consumers that utilize such metadata, and the effectiveness of doing so is still largely unknown. As it is not yet certain how these mechanisms will be used, implementations and feedback are encouraged.

1.1. Notational Conventions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#), [RFC2119].

1.2. Terminology

The term "link relation" refers to the value of the Atom link elements rel attribute as defined in [Section 4.2.7.2 of \[RFC4287\]](#).

The term "license" refers to a potentially machine-readable description of explicit rights that have been granted to consumers of an Atom feed or entry. Rights granted by a license may be associated with obligations that must be assumed by those exercising those rights.

Atom allows the use of Internationalized Resource Identifiers (IRIs) [RFC3987]. Every URI [RFC3986] is also an IRI, so a URI may be used wherever below an IRI is named. When an IRI that is not also a URI is given for dereferencing, it MUST be mapped to a URI using the steps in [Section 3.1 of \[RFC3987\]](#).

Atom allows the use of the xml:base attribute [W3C.REC-xmlbase-20010627] to establish the base URI (or IRI) used to resolve any relative references as described in [Section 5.1.1 of \[RFC3986\]](#).

Atom allows the use of the xml:lang attribute to indicate the natural language of an element, its attributes, and its descendents. The language context is only significant for elements and attributes declared to be "Language-Sensitive" as described in [RFC4287]. The title attribute of the atom:link element is defined as being Language-Sensitive.

2. The "license" Link Relation

The "license" link relation can be used to associate licenses with a feed or entry.

Feed and entry elements MAY contain any number of "license" link relations but MUST NOT contain more than one with the same combination of href and type attribute values. The IRI specified by the link's href attribute SHOULD be dereferenceable to return a representation of the license. The license representation MAY be machine readable.

Feeds and entries can be dual-licensed by including multiple "license" link relations specifying different href attribute values. If multiple "license" link relations are specified, each SHOULD contain a title attribute specifying a human-readable label for the license.

2.1. Unspecified License Links

A publisher can use an "unspecified license link" (a "license" link relation with an href attribute value equal to "<http://purl.org/atompub/license#unspecified>") to indicate that a feed or license has not been explicitly linked to a license description.

A feed or entry containing an unspecified license link MUST NOT contain any other "license" link relations.

2.2. Comparing License Links

Atom implementations that are capable of supporting "license" links SHOULD use the simple string-comparison method described in [\[RFC3987\]](#), [Section 5.3.1](#), to determine whether multiple "license" links are equivalent. The other comparison methods discussed in [Section 5.1](#) of the IRI specification MAY be used. If the "license" link is specified using a relative reference, it MUST be converted to its fully qualified form before comparison.

2.3. Example

```
<feed xmlns="http://www.w3.org/2005/Atom">
  <id>http://www.example.com/myfeed</id>
  <title>My Example Feed</title>
  <updated>2005-07-28T12:00:00Z</updated>
  <link href="http://www.example.com/myfeed" />
  <link rel="license" type="application/rdf+xml"
    href="http://creativecommons.org/licenses/by-nc/2.5/rdf" />
```

```

  <title>Atom Powered Robots Run Amok</title>
  <updated>2005-06-28T12:00:00Z</updated>
  <link href="http://www.example.org/entries/1" />
  <summary>Atom Powered Robots Run Amok</summary>
  <author><name>Jane Smith</name></author>
  <link rel="license" type="text/html"
    href="http://creativecommons.org/licenses/by/2.5/" />
</entry>
</feed>
```

2.4. Inherited Licenses

"License" links specified within atom:feed or atom:source elements are inherited by entries. Generally, a more specific license overrides a less specific license. More specifically, if an atom:entry has any "license" link relations, including the "undefined" license, it does not inherit any license from a containing atom:feed element or contained atom:source element. If an entry has no "license" link relations, and contains an atom:source element, it inherits licenses from the atom:source. If the atom:source element contains no "license" links, or if the entry does not have an atom:source element, the entry inherits licenses from the containing atom:feed.

An entry's license MAY be inherited by media resources associated with the entry. Some media types have ways of including license information, which always overrides the entry's licensing.

An agent searching to find entries that fall under a specific license (e.g. a search for entries containing pictures and the word "knitting" where the entry is under any Creative Commons license) MUST check the most granular license definition available, rather than assume license inheritance without checking.

2.5. Relationship with the atom:rights Element

"License" link relations are related to the atom:rights element in that both are intended to communicate information about the rights

associated with an Atom document. Where the two differ, however, is in the fact that `atom:rights` is intended strictly as a human-readable assertion of rights held over a work while the "license" link relation is intended to provide a potentially machine-readable description of what rights have been granted to others. The two constructs may overlap one another and conflicts could arise if they are contradictory. It is important that publishers of Atom documents ensure that the `atom:rights` and "license" link relations are consistent with one another.

If an `atom:entry` that does not contain an `atom:source` is copied from one feed into another feed, then if the feed into which it is copied contains a license, an `atom:source` element SHOULD be added to the copied entry. If a source feed contains a license, that license SHOULD be preserved in an `atom:source` element added to any entries copied from the source feed that do not already contain `atom:source` elements.

3. Security Considerations

When "license" link relations are used in Atom documents, the security considerations specified in [\[RFC4287\] Section 8](#) apply.

4. IANA Considerations

This specification defines one new Atom link relation type to be registered in the IANA Registry of Link Relations as defined by [\[RFC4287\]](#).

Attribute Value: license

Description: Specifies the IRI of a license associated with the containing feed, entry, or source element.

Expected display characteristics: None

Security considerations: When "license" link relations are used in Atom documents, the security considerations for handling links in Atom documents apply.
