ASSIGNED NUMBERS

Status of this Memo

This memo is an official status report on the numbers used in protocols in the ARPA-Internet community. Distribution of this memo is unlimited.

Introduction

This Network Working Group Request for Comments documents the currently assigned values from several series of numbers used in network protocol implementations. This RFC will be updated periodically, and in any case current information can be obtained from Joyce Reynolds. The assignment of numbers is also handled by Joyce. If you are developing a protocol or application that will require the use of a link, socket, port, protocol, network number, etc., please contact Joyce to receive a number assignment.

Joyce Reynolds
USC - Information Sciences Institute
4676 Admiralty Way

Phone: (213) 822-1511

ARPA mail: JKREYNOLDS@USC-ISIF.ARPA

Most of the protocols mentioned here are documented in the RFC series of notes. The more prominent and more generally used are documented in the "Internet Protocol Transition Workbook" [33] or in the old "ARPANET Protocol Handbook" [34] prepared by the NIC. Some of the items listed are undocumented. Further information on protocols can be found in the memo "Official ARPA-Internet Protocols" [89].

In all cases the name and mailbox of the responsible individual is indicated. In the lists that follow, a bracketed entry, e.g., [nn,iii], at the right hand margin of the page indicates a reference for the listed protocol, where the number ("nn") cites the document and the letters ("iii") cites the person. Whenever possible, letters are a NIC Ident as used in the WHOIS service.

October 1984

ASSIGNED NETWORK NUMBERS

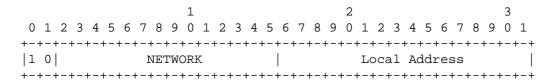

The network numbers listed here are used as internet addresses by the Internet Protocol (IP) [33,77]. The IP uses a 32-bit address field and divides that address into a network part and a "rest" or local address part. The division takes 3 forms or classes.

The first type of address, or class A, has a 7-bit network number and a 24-bit local address. The highest-order bit is set to 0. This allows 128 class A networks.

										1										2										3	
0	1	2	3	4	5	б	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
+	⊢ – +	+	- - +	+-+		⊢ – +	+-+	+		+-+	- - +	 -	+ - -	+-+	 -	+	⊢ – +		- -	- - +		+	-	- - +	⊢ – +	-	- - +	⊢ – +	⊢ – +	+	+
0		1	(E	ľWC	DRI	7										Lo	oca	al	Αc	ldı	ces	ss									
+	H — H	+	 	+	+	- - +	+-+	+		+-+	- - +	 -	 	+-+	 -	 	H — H	+	-	- - +	+	+	+	- - +	- - +	+	- - +	- - +	+	+	+

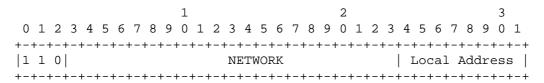

Class A Address

The second type of address, class B, has a 14-bit network number and a 16-bit local address. The two highest-order bits are set to 1-0. This allows 16,384 class B networks.

Class B Address

The third type of address, class C, has a 21-bit network number and a 8-bit local address. The three highest-order bits are set to 1-1-0. This allows 2,097,152 class C networks.

Class C Address

Note: No addresses are allowed with the three highest-order bits set to 1-1-1. These addresses (sometimes called "class D") are reserved.

One commonly used notation for internet host addresses divides the 32-bit address into four 8-bit fields and specifies the value of each field as a decimal number with the fields separated by periods. This is called the "dotted decimal" notation. For example, the internet address of USC-ISIF.ARPA in dotted decimal is 010.002.000.052, or 10.2.0.52.

The dotted decimal notation will be used in the listing of assigned network numbers. The class A networks will have nnn.rrr.rrr, the class B networks will have nnn.nnn.rrr, and the class C networks will have nnn.nnn.rrr, where nnn represents part or all of a network number and rrr represents part or all of a local address.

There are four catagories of users of Internet Addresses: Research, Defense, Government (Non-Defense), and Commercial. To reflect the allocation of network identifiers among the categories, a one-character code is placed to the left of the network number: R for Research, D for Defense, G for Government, and C for Commercial (see Appendix A for further details on this division of the network identification).

Network numbers are assigned for networks that are connected to the ARPA-Internet and DDN-Internet, and for independent networks that use the IP family protocols (these are usually commercial). These independent networks are marked with an asterisk preceding the number.

The administrators of independent networks must apply separately for permission to interconnect their network with either the ARPA-Internet of the DDN-Internet. Independent networks need not be listed in the working tables of either the ARPA-Internet or DDN-Internet hosts or gateways.

For various reasons, the assigned numbers of networks are sometimes changed. To ease the transition the old number will be listed for a transition period as well. These "old number" entries will be marked with a "T" following the number and preceding the name, and the network name will be suffixed "-TEMP".

Special Addresses:

In certain contexts, it is useful to have fixed addresses with functional significance rather than as identifiers of specific hosts. When such usage is called for, the address zero is to be interpreted as meaning "this", as in "this network". The address of all ones are to be interpreted as meaning "all", as in "all hosts". For example, the address 128.9.255.255 could be

interpreted as meaning all hosts on the network 128.9. Or, the address 0.0.0.37 could be interpreted as meaning host 37 on this network.

ASSIGNED VERSION NUMBERS

In the Internet Protocol (IP) [33,77] there is a field to identify the version of the internetwork general protocol. This field is 4 bits in size.

Assigned Internet Version Numbers

Decimal	Keyword	Version	References
0		Reserved	[JBP]
1-3		Unassigned	[JBP]
4	IP	Internet Protocol	[31,71,JBP]
5	ST	ST Datagram Mode	[34,JWF]
6-14		Unassigned	[JBP]
15		Reserved	[JBP]

ASSIGNED PROTOCOL NUMBERS

In the Internet Protocol (IP) [33,77] there is a field, called Protocol, to identify the the next level protocol. This is an 8 bit field.

Assigned Internet Protocol Numbers

Decimal	Keyword	Protocol	References
0		Reserved	[JBP]
1	ICMP	Internet Control Message	[69,JBP]
2		Unassigned	[JBP]

ASSIGNED PORT NUMBERS

Ports are used in the TCP [33,78] to name the ends of logical connections which carry long term conversations. For the purpose of providing services to unknown callers, a service contact port is defined. This list specifies the port used by the server process as its contact port. The contact port is sometimes called the "well-known port".

To the extent possible, these same port assignments are used with the UDP [33,76].

The assigned ports use a small portion of the possible port numbers. The assigned ports have all except the low order eight bits cleared to zero. The low order eight bits are specified here.

Port Assignments:

Decimal	Keyword	Description	References
0		Reserved	[JBP]
1-4		Unassigned	[JBP]
5	RJE	Remote Job Entry	[13,34,JBP]
7	ECHO	Echo	[67,JBP]

245	LINK	LINK	[14,RDB2]
247-255		Unassigned	[JBP]

ASSIGNED AUTONOMOUS SYSTEM NUMBERS

The Exterior Gateway Protocol (EGP) [93,90] specifies that groups of gateways may form autonomous systems. The EGP provides a 16-bit field for identifying such systems. The values of this field are registered here.

Autonomous System Numbers:

Decimal	Name	References
0	 Reserved	[JBP]
1	The BBN Gateways	[MB]
2	DCN-AS	[DLM1]
3	The MIT Gateways	[LM8]

36-65534	Unassigned	[JBP]

Assigned Numbers Autonomous System Numbers	RFC 923
65535 Reserved	[JBP]

ASSIGNED ARPANET LOGICAL ADDRESSES

The ARPANET facility for "logical addressing" is described in RFC 878 [56]. A portion of the possible logical addresses are reserved for standard uses.

There are 49,152 possible logical host addresses. Of these, 256 are reserved for assignment to well-known functions. Assignments for well-known functions are made by Joyce Reynolds. Assignments for other logical host addresses are made by the NIC.

Logical Address Assignments:

Decimal	Description	References
0	Reserved	[JBP]
1	The BBN Gateways	[MB]
2-255	Unassigned	[JBP]
256	Reserved	[JBP]

ASSIGNED ARPANET LINK NUMBERS

The word "link" here refers to a field in the original ARPANET Host/IMP interface leader. The link was originally defined as an 8-bit field. Later specifications defined this field as the "message-id" with a length of 12 bits. The name link now refers to the high order 8 bits of this 12-bit message-id field. The Host/IMP interface is defined in BBN Report 1822 [7].

The low-order 4 bits of the message-id field are called the sub-link. Unless explicitly specified otherwise for a particular protocol, there is no sender to receiver significance to the sub-link. The sender may use the sub-link in any way he chooses (it is returned in the RFNM by the destination IMP), the receiver should ignore the sub-link.

Link Assignments:

Decimal	Description	References
0	Reserved	[JBP]
1-149	Unassigned	[JBP]
150	Xerox NS IDP	[109,LLG]
151	Unassigned	[JBP]
152	PARC Universal Protocol	[11,HGM]
153	TIP Status Reporting	[JGH]
154	TIP Accounting	[JGH]
155	Internet Protocol [regular]	[33,77,JBP]
156-158	Internet Protocol [experimental]	[33,77,JBP]
159	Figleaf Link	[JBW1]
160-195	Unassigned	[JBP]
196-247	Experimental Protocols	[JBP]
248-255	Network Maintenance	[JGH]

IEEE 802 SAP NUMBERS OF INTEREST

Many of the networks of all classes are IEEE 802 Networks. These systems use a Service Access Point field in much the same way the ARPANET uses the "link" field. For further information and SAP number assignments, please contact: Mr. Maris Graube, Chairman, IEEE 802, c/o Tektronix, P.O. Box 500, D/S 50-473, Beaverton, Oregon, 97077.

Assignments:

Service Access Point	Description	References
decimal binary		
96 01100000	DOD IP	[33,76,JBP]

ETHERNET NUMBERS OF INTEREST

Many of the networks of all classes are Ethernets (10Mb) or Experimental Ethernets (3Mb). These systems use a message "type" field in much the same way the ARPANET uses the "link" field.

If you need an Ethernet number, contact the XEROX Corporation, Office Products Division, Network Systems Administration Office, 333 Coyote Hill Road, Palo Alto, California, 94304.

Assignments:

Ethernet		Exp. Ethernet		Description	References	
decimal	Hex	deci	mal	octal		
512	0200	5	12	1000	XEROX PUP	[1, HGM]

32821	8035	-		-	Reverse ARP	[36,JCM]
36864	9000	-		_	Loopback	[LLG]

The standard for transmission of IP datagrams over Ethernets and Experimental Ethernets is specified in RFC 894 [48] and RFC 895 [63] respectively.

ASSIGNED ADDRESS RESOLUTION PROTOCOL PARAMETERS

The Address Resolution Protocol (ARP) specified in RFC $826\ [61]$ has several parameters. The assigned values for these parameters are listed here.

Assignments:

Operation Code (op)

- 1 REQUEST
- 2 REPLY

Hardware Type (hrd)

Type	Description	References
1	Ethernet (10Mb)	[JBP]
2	Experimental Ethernet (3Mb)	[JBP]
3	Amateur Radio AX.25	[PXK]

Protocol Type (pro)

Use the same codes as listed in the section called "Ethernet Numbers of Interest".

ASSIGNED PUBLIC DATA NETWORK NUMBERS

One of the Internet Class A Networks is the international system of Public Data Networks. This section lists the mapping between the Internet Addresses and the Public Data Network Addresses (X.121).

Assignments:

Internet	Public Data Ne	et	Description	References
014.000.000.000			Reserved	[JBP]
014.000.000.001	3110-317-00035	00	PURDUE-TN	[CAK]

014.255.255.255			Reserved	[JBP]

The standard for transmission of IP datagrams over the Public Data Network is specified in RFC 877 [52].

ASSIGNED TELNET OPTIONS

The Telnet Protocol has a number of options that may be negotiated. These options are listed here. "Official ARPA-Internet Protocols" [89] provides more detailed information.

Options	Name	References
0	Binary Transmission	[82,JBP]
1	Echo	[83,JBP]
2	Reconnection	[5,JBP]
3	Suppress Go Ahead	[86,JBP]
4	Approx Message Size Negotiation	[34,JBP]
5	Status	[85,JBP]
6	Timing Mark	[87,JBP]
7	Remote Controlled Trans and Echo	[79,JBP]
8	Output Line Width	[3,JBP]
9	Output Page Size	[4,JBP]
10	Output Carriage-Return Disposition	[22,JBP]
11	Output Horizontal Tab Stops	[26,JBP]
12	Output Horizontal Tab Disposition	[25,JBP]
13	Output Formfeed Disposition	[23,JBP]
14	Output Vertical Tabstops	[28,JBP]
15	Output Vertical Tab Disposition	[27,JBP]
16	Output Linefeed Disposition	[24,JBP]
17	Extended ASCII	[105,JBP]
18	Logout	[19,MRC]
19	Byte Macro	[29,JBP]
20	Data Entry Terminal	[31,JBP]
22	SUPDUP	[21,20,MRC]
22	SUPDUP Output	[39,MRC]

OFFICIAL PROTOCOL AND SERVICE NAMES

These are the Official Protocol Names. Their use is described in greater detail in RFC 810 [35].

ARGUS - ARGUS Protocol

AUTH - Authentication Service BBN-RCC-MON - BBN RCC Monitoring

BR-SAT-MON - Backroom SATNET Monitoring

CFTP - CFTP

CHAOS - CHAOS Protocol

CHARGEN - Character Generator Protocol
CLOCK - DCNET Time Server Protocol

CSNET-NS - CSNET Mailbox Nameserver Protocol

DAYTIME - Daytime Protocol

DCN-MEAS - DCN Measurement Subsystems Protocol

DCP - Device Control Protocol

DISCARD - Discard Protocol

DOMAIN - Domain Name Server

ECHO - Echo Protocol

EGP - Exterior Gateway Protocol
EMCON - Emission Control Protocol

FINGER - Finger Protocol

FTP - File Transfer Protocol
GGP - Gateway Gateway Protocol

GRAPHICS - Graphics Protocol

HMP - Host Monitoring Protocol

HOST2-NS - Host2 Name Server HOSTNAME - Hostname Protocol

ICMP - Internet Control Message Protocol

IGP - Interior Gateway Protocol

IP - Internet Protocol

LEAF-1 - Leaf-1 Protocol

LEAF-2 - Leaf-2 Protocol

LINK - Link Protocol

LOGIN - Login Host Protocol

METAGRAM Motogram Bolov

METAGRAM - Metagram Relay
MIT-ML-DEV - MIT ML Device
MIT-SUBNET - MIT Subnet Support
MIT-DOV - MIT Dover Spooler

MPM - Internet Message Protocol

MPM-FLAGS - MP Flags Protocol

MSG-AUTH - MSG Authentication Protocol

MSG-ICP - MSG ICP Protocol

MUX - Multiplexing Protocol NAMESERVER - Host Name Server

NETED - Network Standard Text Editor

NETRJS - Remote Job Service

NI-FTP - NI File Transfer Protocol

NI-MAIL - NI Mail Protocol NICNAME - Who Is Protocol

NSW-FE - NSW User System Front End
NVP-II - Network Voice Protocol
POP - Post Office Protocol
PRM - Packet Radio Measurement

PUP - PUP Protocol

QUOTE - Quote of the Day Protocol RDP - Reliable Data Protocol

RJE - Remote Job Entry

RLP - Resource Location Protocol
RTELNET - Remote Telnet Service

RVD - Remote Virtual Disk Protocol SAT-EXPAK - Satnet and Backroom EXPAK

SAT-MON - SATNET Monitoring

SFTP - Simple File Transfer Protocol
SMTP - Simple Mail Transfer Protocol

ST - Stream Protocol

SU-MIT-TG - SU/MIT Telnet Gateway Protocol
SUNRPC - SUN Remote Procedure Call

SUPDUP - SUPDUP Protocol SUR-MEAS - Survey Measurement

SWIFT-RVF - Remote Virtual File Protocol
TCP - Transmission Control Protocol

TELNET - Telnet Protocol

TFTP - Trivial File Transfer Protocol

TIME - Time Server Protocol
TRUNK-1 - Trunk-1 Protocol
TRUNK-2 - Trunk-2 Protocol

UCL - University College London Protocol

UDP - User Datagram Protocol
USERS - Active Users Protocol
UUCP-PATH - UUCP Path Service

VIA-FTP - VIA Systems-File Transfer Protocol

WB-EXPAK - Wideband EXPAK
WB-MON - Wideband Monitoring
XNET - Cross Net Debugger

XNS-IDP - Xerox NS IDP

OFFICIAL TERMINAL TYPE NAMES

These are the Official Terminal Type Names. Their use is described in RFC 884 [97].

APPENDIX A

Network Numbers

The network numbers in class A, B, and C network addresses are allocated among Research, Defense, Government (Non-Defense) and Commercial uses.

Class A (highest-order bit 0)

Research allocation:	8
Defense allocation:	24
Government allocation:	24
Commercial allocation:	94
Reserved Addresses: (0, 127)	
Total	128

Class B (highest-order bits 1-0)

Research allocation:		1024
Defense allocation:		3072
Government allocation	n:	3072
Commercial allocation	n:	12286
Reserved Addresses:	(0,	16383)
Total		16384

Class C (highest-order bits 1-1-0)

Research allocation:	65536
Defense allocation:	458725
Government allocation:	458725
Commercial allocation:	1572862
Reserved Addresses: (0,	2097151)
Total	2097152

Class D (highest-order bits 1-1-1)

All addresses in this class are reserved for future use.

Within the Research community, network identifiers will only be granted to applicants who show evidence that they are acquiring standard Bolt Beranek and Newman gateway software or have implemented or are acquiring a gateway meeting the Exterior Gateway Protocol requirements. Acquisition of the Berkeley BSD 4.2 UNIX software might be considered evidence of the latter.

Experimental networks which later become operational need not be renumbered. Rather, the identifiers could be moved from Research to Defense, Government or Commercial status. Thus, network identifiers may change state among Research, Defense, Government and Commercial, but the number of identifiers allocated to each use must remain within the limits indicated above. To make possible this fluid assignment, the network identifier spaces are not allocated by simple partition, but rather by specific assignment.

Protocol Identifiers

These assignments are shared by the four communities.

Port Numbers

These assignments are shared by the four communities.

ARPANET Link Numbers

These assignments are shared by the four communities.

IP Version Numbers

These assignments are shared by the four communities.

TCP, IP and Telnet Option Identifiers

These assignments are shared by the four communities.

Implementation:

Joyce Reynolds is the coordinator for all number assignments.
