PROTOCOL STANDARD FOR A NetBIOS SERVICE ON A TCP/UDP TRANSPORT: DETAILED SPECIFICATIONS

ABSTRACT

This RFC defines a proposed standard protocol to support NetBIOS services in a TCP/IP environment. Both local network and internet operation are supported. Various node types are defined to accommodate local and internet topologies and to allow operation with or without the use of IP broadcast.

This RFC gives the detailed specifications of the NetBIOS-over-TCP packets, protocols, and defined constants and variables. A more general overview is found in a companion RFC, "Protocol Standard For a NetBIOS Service on a TCP/UDP Transport: Concepts and Methods".

PROTOCOL STANDARD FOR A NetBIOS SERVICE ON A TCP/UDP TRANSPORT: DETAILED SPECIFICATIONS

1. STATUS OF THIS MEMO

This RFC specifies a proposed standard for the DARPA Internet community. Since this topic is new to the Internet community, discussions and suggestions are specifically requested.

Please send written comments to:

Karl Auerbach
Epilogue Technology Corporation
P.O. Box 5432
Redwood City, CA 94063

Please send online comments to:

Avnish Aggarwal

Distribution of this memorandum is unlimited.

2. ACKNOWLEDGEMENTS

This RFC has been developed under the auspices of the Internet Activities Board.

The following individuals have contributed to the development of this RFC:

Arvind Agrawal Avnish Aggarwal Lorenzo Aguilar Geoffrey Arnold Karl Auerbach K. Ramesh Babu Keith Ball Amatzia Ben-Artzi Vint Cerf Richard Cherry David Crocker Steve Deering Greg Ennis Steve Holmgren Jay Israel David Kaufman Lee LaBarre James Lau Gaylord Miyata David Stevens Dan Lynch

Steve Thomas Ishan Wu

The system proposed by this RFC does not reflect any existing Netbios-over-TCP implementation. However, the design incorporates considerable knowledge obtained from prior implementations. Special thanks goes to the following organizations which have provided this invaluable information:

CMC/Syros Excelan Sytek Ungermann-Bass

3. INTRODUCTION

This RFC contains the detailed packet formats and protocol specifications for NetBIOS-over-TCP. This RFC is a companion to RFC 1001, "Protocol Standard For a NetBIOS Service on a TCP/UDP Transport: Concepts and Methods" [1].

4. PACKET DESCRIPTIONS

Bit and byte ordering are defined by the most recent version of "Assigned Numbers" [2].

4.1. NAME FORMAT

The NetBIOS name representation in all NetBIOS packets (for NAME, SESSION, and DATAGRAM services) is defined in the Domain Name Service RFC 883[3] as "compressed" name messages. This format is called "second-level encoding" in the section entitled "Representation of NetBIOS Names" in the Concepts and Methods document.

For ease of description, the first two paragraphs from page 31, the section titled "Domain name representation and compression", of RFC 883 are replicated here:

Domain names messages are expressed in terms of a sequence of labels. Each label is represented as a one octet length field followed by that number of octets. Since every domain name ends with the null label of the root, a compressed domain name is terminated by a length byte of zero. The high order two bits of the length field must be zero, and the remaining six bits of the length field limit the label to 63 octets or less.

To simplify implementations, the total length of label octets and label length octets that make up a domain name is restricted to 255 octets or less.

The following is the uncompressed representation of the NetBIOS name "FRED ", which is the 4 ASCII characters, F, R, E, D, followed by 12 space characters (0x20). This name has the SCOPE_ID: "NETBIOS.COM"

EGFCEFEECACACACACACACACACACA.NETBIOS.COM

This uncompressed representation of names is called "first-level encoding" in the section entitled "Representation of NetBIOS Names" in the Concepts and Methods document.

The following is a pictographic representation of the compressed representation of the previous uncompressed Domain Name representation.

0 1 2 3 4 5 6 7	8 9 0 1 2 3 4 5		4 5 6 7 8 9 0 1
0x20	E (0x45)	G (0x47)	F (0x46)
	E (0x45)	F (0x46)	
E (0x45)	C (0x43)	A (0x41)	C (0x43)
	C (0x43)	A (0x41)	C (0x43)
A (0x41)	C (0x43)	A (0x41)	C (0x43)
	C (0x43)	A (0x41)	C (0x43)
A (0x41)	C (0x43)	A (0x41)	C (0x43)
A (0x41)	C (0x43)	A (0x41)	C (0x43)
A (0X41)	0x07	N (0x4E)	E (0x45)
T (0x54)	B (0x42)	I (0x49)	O (0x4F)
	0x03	C (0x43)	O (0x4F)
M (0x4D)	0x00		

Each section of a domain name is called a label [7 (page 31)]. A label can be a maximum of 63 bytes. The first byte of a label in compressed representation is the number of bytes in the label. For the above example, the first 0x20 is the number of bytes in the left-most label, EGFCEFEECACACACACACACACACACACACACACA, of the domain name. The bytes following the label length count are the characters of the label. The following labels are in sequence after the first label, which is the encoded NetBIOS name, until a zero (0x00) length count. The zero length count represents the root label, which is always null.

A label length count is actually a 6-bit field in the label length field. The most significant 2 bits of the field, bits 7 and 6, are flags allowing an escape from the above compressed representation. If bits 7 and 6 are both set (11), the following 14 bits are an offset pointer into the full message to the actual label string from another domain name that belongs in this name. This label pointer allows for a further compression of a domain name in a packet.

NetBIOS implementations can only use label string pointers in Name Service packets. They cannot be used in Session or Datagram Service packets.

The other two possible values for bits 7 and 6 (01 and 10) of a label length field are reserved for future use by RFC 883[2 (page 32)].

Note that the first octet of a compressed name must contain one of the following bit patterns. (An "x" indicates a bit whose value may be either 0 or 1.):

00100000 - Netbios name, length must be 32 (decimal)

11xxxxxx - Label string pointer

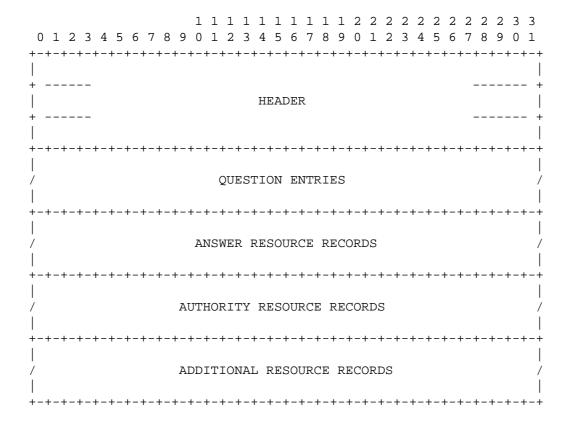

10xxxxxx - Reserved 01xxxxxx - Reserved

4.2. NAME SERVICE PACKETS

4.2.1. GENERAL FORMAT OF NAME SERVICE PACKETS

The NetBIOS Name Service packets follow the packet structure defined in the Domain Name Service (DNS) RFC 883 [7 (pg 26-31)]. The structures are compatible with the existing DNS packet formats, however, additional types and codes have been added to work with NetBIOS.

If Name Service packets are sent over a TCP connection they are preceded by a 16 bit unsigned integer representing the length of the Name Service packet.

4.2.1.1. HEADER

Field Description

NAME_TRN_ID Transaction ID for Name Service Transaction.

Requestor places a unique value for each active transaction. Responder puts NAME_TRN_ID value from request packet in response packet.

OPCODE Packet type code, see table below.

NM_FLAGS Flags for operation, see table below.

RCODE Result codes of request. Table of RCODE values

for each response packet below.

QDCOUNT Unsigned 16 bit integer specifying the number of

entries in the question section of a Name

Service packet. Always zero (0) for responses. Must be non-zero for all NetBIOS Name requests.

ANCOUNT Unsigned 16 bit integer specifying the number of

resource records in the answer section of a Name

Service packet.

NSCOUNT Unsigned 16 bit integer specifying the number of

resource records in the authority section of a

Name Service packet.

ARCOUNT Unsigned 16 bit integer specifying the number of

resource records in the additional records

section of a Name Service packet.

The OPCODE field is defined as:

0 1 2 3 4 +---+--+--+--+ | R | OPCODE | +---+--+

```
Symbol
         Bit(s) Description
OPCODE
             1 - 4
                  Operation specifier:
                     0 = query
                     5 = registration
                     6 = release
                     7 = WACK
                     8 = refresh
                  RESPONSE flag:
R
               0
                    if bit == 0 then request packet
                     if bit == 1 then response packet.
The NM_FLAGS field is defined as:
 0 1 2 3 4 5 6
+---+
|AA |TC |RD |RA | 0 | 0 | B |
+---+
Symbol Bit(s) Description
В
               6
                  Broadcast Flag.
                    = 1: packet was broadcast or multicast
                    = 0: unicast
RA
               3
                  Recursion Available Flag.
                   Only valid in responses from a NetBIOS Name
                   Server -- must be zero in all other
                   responses.
                   If one (1) then the NBNS supports recursive
                   query, registration, and release.
                   If zero (0) then the end-node must iterate
                   for query and challenge for registration.
RD
                  Recursion Desired Flag.
                   May only be set on a request to a NetBIOS
                   Name Server.
                   The NBNS will copy its state into the
                   response packet.
                   If one (1) the NBNS will iterate on the
                   query, registration, or release.
TC
                 Truncation Flag.
```

Set if this message was truncated because the datagram carrying it would be greater than 576 bytes in length. Use TCP to get the information from the NetBIOS Name Server.

AA

0 Authoritative Answer flag.

Must be zero (0) if R flag of OPCODE is zero (0).

If R flag is one (1) then if AA is one (1) then the node responding is an authority for the domain name.

End nodes responding to queries always set this bit in responses.

4.2.1.2. QUESTION SECTION

Field Description

QUESTION_NAME The compressed name representation of the NetBIOS name for the request.

QUESTION_TYPE The type of request. The values for this field are specified for each request.

QUESTION_CLASS The class of the request. The values for this field are specified for each request.

QUESTION_TYPE is defined as:

Symbol Value Description:

NB 0x0020 NetBIOS general Name Service Resource Record NBSTAT 0x0021 NetBIOS NODE STATUS Resource Record (See NODE STATUS REQUEST)

QUESTION_CLASS is defined as:

Symbol Value Description:

IN 0x0001 Internet class

4.2.1.3. RESOURCE RECORD

```
\begin{smallmatrix} 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 0 & 1 \\ \end{smallmatrix}
                       RR_NAME
RR_TYPE
                                  RR_CLASS

RDLENGTH
RDATA
Field
             Description
RR NAME
             The compressed name representation of the
             NetBIOS name corresponding to this resource
             record.
RR_TYPE
             Resource record type code
RR CLASS
             Resource record class code
TTT.
             The Time To Live of a the resource record's
             name.
             Unsigned 16 bit integer that specifies the
RDLENGTH
             number of bytes in the RDATA field.
RDATA
             RR CLASS and RR TYPE dependent field. Contains
             the resource information for the NetBIOS name.
RESOURCE RECORD RR_TYPE field definitions:
Symbol
         Value Description:
```

0x0001 IP address Resource Record (See REDIRECT NAME

0x0002 Name Server Resource Record (See REDIRECT

QUERY RESPONSE)

NAME QUERY RESPONSE)

NULL 0x000A NULL Resource Record (See WAIT FOR ACKNOWLEDGEMENT RESPONSE)

NB 0x0020 NetBIOS general Name Service Resource Record (See NB_FLAGS and NB_ADDRESS, below)

NBSTAT 0x0021 NetBIOS NODE STATUS Resource Record (See NODE STATUS RESPONSE)

RESOURCE RECORD RR_CLASS field definitions:

Symbol Value Description:

IN 0x0001 Internet class

NB_FLAGS field of the RESOURCE RECORD RDATA field for RR_TYPE of "NB":

											1	1	1	1	1	1
0		1	2	3	4	5	6	7	8	9	0	1	2	3	4	5
+	-+-	+-	+-	+	+	+-	+	+	+-	+-	+	+	+	+	+	+
G		ONT	r]	RESE	RVED							
+	-+-	+-	+	+	+	+	+	+	+	+	+	+	+	+	+	+

Symbol Bit(s) Description:

RESERVED 3-15 Reserved for future use. Must be zero (0). ONT 1,2 Owner Node Type:

00 = B node

01 = P node

10 = M node

11 = Reserved for future use

For registration requests this is the

claimant's type.

For responses this is the actual owner's type.

G 0 Group Name Flag.

If one (1) then the RR_NAME is a GROUP NetBIOS name.

If zero (0) then the RR_NAME is a UNIQUE

NetBIOS name.

The NB_ADDRESS field of the RESOURCE RECORD RDATA field for RR_TYPE of "NB" is the IP address of the name's owner.

4.2.2. NAME REGISTRATION REQUEST

Since the RR_NAME is the same name as the QUESTION_NAME, the RR_NAME representation must use label string pointers to the QUESTION_NAME labels to guarantee the length of the datagram is less than the maximum 576 bytes. This is the same condition as with the NAME REGISTRATION REQUEST.

4.2.10. POSITIVE NAME RELEASE RESPONSE

0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 |1| 0x6 |1|0|0|0|0 0|0| 0x0 | NAME_TRN_ID 0x00000x0000 0×00000 RR_NAME NB (0×0020) IN (0×0001) NB FLAGS NB_ADDRESS

4.2.11. NEGATIVE NAME RELEASE RESPONSE

0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 |1| 0x6 |1|0|0|0|0 0|0| RCODE | NAME_TRN_ID 0×0000 0×0001 0x00000x0000RR_NAME IN (0x0001)NB (0x0020) ${
m TTL}$ NB_FLAGS NB_ADDRESS

RCODE field values:

Symbol	Value	Description:
FMT_ERR	0x1	Format Error. Request was invalidly formatted.
SRV_ERR	0x2	Server failure. Problem with NBNS, cannot process name.
RFS_ERR	0x5	Refused error. For policy reasons server will not release this name from this host.
ACT_ERR	0x6	Active error. Name is owned by another node. Only that node may release it. A NetBIOS Name Server can optionally allow a node to release a name it does not own. This would facilitate detection of inactive names for nodes that went down silently.

4.2.12. NAME QUERY REQUEST

ADDR_ENTRY ARRAY														

The ADDR_ENTRY ARRAY a sequence of zero or more ADDR_ENTRY records. Each ADDR_ENTRY record represents an owner of a name. For group names there may be multiple entries. However, the list may be incomplete due to packet size limitations. Bit 22, "T", will be set to indicate truncated data.

Each ADDR_ENTRY has the following format:

+-+-+-+-+-+-	+-
NB_FLAGS	NB_ADDRESS
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-	+-
NB_ADDRESS (continued)	
+-+-+-+-+-+-	+

4.2.14. NEGATIVE NAME QUERY RESPONSE

1 1 1 1 1 1 1 1 1 1 2 2 2 2 2 2 2 2 2 3 3 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 |1| 0x0 |1|0|1|?|0 0|0| RCODE | NAME_TRN_ID 0x00000x00000x00000x0000RR_NAME NULL (0x000A) IN (0x0001)0x000000000x0000

RCODE field values:

Symbol	Value	Description
FMT_ERR	0x1	Format Error. Request was invalidly formatted.
SRV_ERR	0x2	Server failure. Problem with NBNS, cannot process name.
NAM_ERR	0x3	Name Error. The name requested does not exist.
IMP_ERR	0x4	Unsupported request error. Allowable only for challenging NBNS when gets an Update type registration request.
RFS_ERR	0x5	Refused error. For policy reasons server will not register this name from this host.

4.2.15. REDIRECT NAME QUERY RESPONSE

1 1 1 1 1 1 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5														
+-+-+-+-+-+-+-+-+-+-+-+-+-+	1 0x0 0 0 1 0 0 0 0 0x0

A (0x0001)	IN (0x0001)													
T	+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+													
0x0004	NSD_IP_ADDR													
NSD_IP_ADDR, continued														

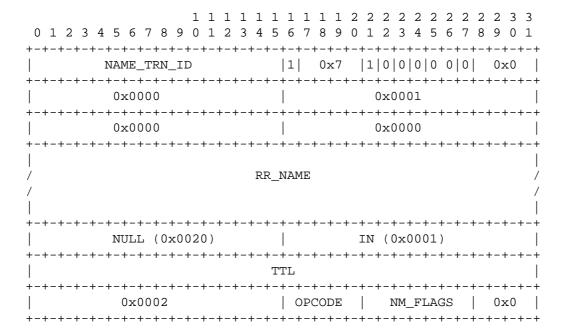

An end node responding to a NAME QUERY REQUEST always responds with the AA and RA bits set for both the NEGATIVE and POSITIVE NAME QUERY RESPONSE packets. An end node never sends a REDIRECT NAME QUERY RESPONSE packet.

When the requestor receives the REDIRECT NAME QUERY RESPONSE it must reiterate the NAME QUERY REQUEST to the NBNS specified by the NSD_IP_ADDR field of the A type RESOURCE RECORD in the ADDITIONAL section of the response packet. This is an optional packet for the NBNS.

The NSD_NAME and the RR_NAME in the ADDITIONAL section of the response packet are the same name. Space can be optimized if label string pointers are used in the RR_NAME which point to the labels in the NSD_NAME.

The RR_NAME in the AUTHORITY section is the name of the domain the NBNS called by NSD_NAME has authority over.

4.2.16. WAIT FOR ACKNOWLEDGEMENT (WACK) RESPONSE

The NAME_TRN_ID of the WACK RESPONSE packet is the same NAME_TRN_ID of the request that the NBNS is telling the requestor to wait longer to complete. The RR_NAME is the name from the request, if any. If no name is available from the request then it is a null name, single byte of zero.

The TTL field of the ResourceRecord is the new time to wait, in seconds, for the request to complete. The RDATA field contains the OPCODE and NM_FLAGS of the request.

A TTL value of 0 means that the NBNS can not estimate the time it may take to complete a response.

4.2.17. NODE STATUS REQUEST

1 1 1 0 1 2 3 4 5 6 7 8 9 0 1 2		2 2 2 2 2 2 2 2 2 3 3 1 2 3 4 5 6 7 8 9 0 1

+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-														
RDLENGTH	NUM_NAMES													
/ /	IODE_NAME ARRAY /													
Ī														
/	STATISTICS /													
+ +-+-+-+-+-+-+-	-++++													

The NODE_NAME ARRAY is an array of zero or more NUM_NAMES entries of NODE_NAME records. Each NODE_NAME entry represents an active name in the same NetBIOS scope as the requesting name in the local name table of the responder. RR_NAME is the requesting name.

NODE_NAME Entry:

The NAME FLAGS field:

												1	1	1	1	1	1	
	0		1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	
+		+	+		++		 +		+	+	+	+			++	+	+	H
	G		ON'	Г	DRG	CNF	ACT	PRM			RE	SERV	/ED					
-		+	+		++				+	+	+	+			++	+	+	H

The NAME_FLAGS field is defined as:

Bit(s) Description: Symbol RESERVED 7-15 Reserved for future use. Must be zero (0). Permanent Name Flag. If one (1) then entry PRM is for the permanent node name. Flag is zero (0) for all other names. ACT 5 Active Name Flag. All entries have this flag set to one (1). CNF 4 Conflict Flag. If one (1) then name on this node is in conflict. DRG Deregister Flag. If one (1) then this name is in the process of being deleted. 1,2 Owner Node Type: ONT 00 = B node01 = P node10 = M node11 = Reserved for future use G Group Name Flag. If one (1) then the name is a GROUP NetBIOS

If zero (0) then it is a UNIQUE NetBIOS name.

4.3. SESSION SERVICE PACKETS

4.3.1. GENERAL FORMAT OF SESSION PACKETS

All session service messages are sent over a TCP connection.

All session packets are of the following general structure:

,		-	_	_	4	_	_	_	_	^	_	_	_	_	_	_	_	_	_	_	_	_	_	_	_	_	_	_	_	_	3	_
																															0 + - +	
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+												LENGTH																				
+- /	+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-															+-+ <i> </i>																
, +-	-+	-+		-	-	-	+											-		-					⊢ — +	-	-	⊢ — +	-	-	⊦ – +	, +-+

The TYPE, FLAGS, and LENGTH fields are present in every session packet.

The LENGTH field is the number of bytes following the LENGTH field. In other words, LENGTH is the combined size of the TRAILER field(s). For example, the POSITIVE SESSION RESPONSE packet always has a LENGTH field value of zero (0000) while the RETARGET SESSION RESPONSE always has a LENGTH field value of six (0006).

One of the bits of the FLAGS field acts as an additional, high-order bit for the LENGTH field. Thus the cumulative size of the trailer field(s) may range from 0 to 128 K bytes.

Session Packet Types (in hexidecimal):

- 00 SESSION MESSAGE
- 81 SESSION REQUEST
- 82 POSITIVE SESSION RESPONSE
- 83 NEGATIVE SESSION RESPONSE
- 84 RETARGET SESSION RESPONSE
- 85 SESSION KEEP ALIVE

Bit definitions of the FLAGS field:

	0		1		2		3		4		5		6		7	
+-		-+-		-+-		-+-		+-		+-		+-		+ -		+
	0		0		0		0		0		0		0		E	
+-		-+-		- + -		- + -		. + .		- + -		. + -		+ -		- +

Symbol Bit(s) Description

E 7 Length extension, used as an additional, high-order bit on the LENGTH field.

RESERVED 0-6 Reserved, must be zero (0)

4.3.2. SESSION REQUEST PACKET

4.3.3. POSITIVE SESSION RESPONSE PACKET

4.3.4. NEGATIVE SESSION RESPONSE PACKET

NEGATIVE SESSION RESPONSE packet error code values (in hexidecimal):

- 80 Not listening on called name
- 81 Not listening for calling name
- 82 Called name not present
- 83 Called name present, but insufficient resources
- 8F Unspecified error

4.3.5. SESSION RETARGET RESPONSE PACKET

4.3.6. SESSION MESSAGE PACKET

4.3.7. SESSION KEEP ALIVE PACKET

4.4. DATAGRAM SERVICE PACKETS

4.4.1. NetBIOS DATAGRAM HEADER

MSG_TYPE values (in hexidecimal):

- 10 DIRECT_UNIQUE DATAGRAM
- 11 DIRECT_GROUP DATAGRAM
- 12 BROADCAST DATAGRAM
- 13 DATAGRAM ERROR
- 14 DATAGRAM QUERY REQUEST
- 15 DATAGRAM POSITIVE QUERY RESPONSE
- 16 DATAGRAM NEGATIVE QUERY RESPONSE

Bit definitions of the FLAGS field:

Symbol Bit(s) Description

M 7 MORE flag, If set then more NetBIOS datagram fragments follow.

F 6 FIRST packet flag, If set then this is first (and possibly only) fragment of NetBIOS datagram

SNT 4,5 Source End-Node type: 00 = B node 01 = P node

10 = M node 11 = NBDD

RESERVED 0-3 Reserved, must be zero (0)

4.4.2. DIRECT_UNIQUE, DIRECT_GROUP, & BROADCAST DATAGRAM

 $\begin{smallmatrix} 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 0 & 1 \\ \end{smallmatrix}$ MSG_TYPE FLAGS SOURCE_IP SOURCE_PORT DGM_LENGTH PACKET_OFFSET SOURCE_NAME DESTINATION_NAME USER_DATA

4.4.3. DATAGRAM ERROR PACKET

ERROR_CODE values (in hexidecimal):

- 82 DESTINATION NAME NOT PRESENT
- 83 INVALID SOURCE NAME FORMAT
- 84 INVALID DESTINATION NAME FORMAT

4.4.4. DATAGRAM QUERY REQUEST

4.4.5. DATAGRAM POSITIVE AND NEGATIVE QUERY RESPONSE

5. PROTOCOL DESCRIPTIONS

5.1. NAME SERVICE PROTOCOLS

A REQUEST packet is always sent to the well known UDP port - NAME_SERVICE_UDP_PORT. The destination address is normally either the IP broadcast address or the address of the NBNS - the address of the NBNS server it set up at initialization time. In rare cases, a request packet will be sent to an end node, e.g. a NAME QUERY REQUEST sent to "challenge" a node.

A RESPONSE packet is always sent to the source UDP port and source IP address of the request packet.

A DEMAND packet must always be sent to the well known UDP port - NAME_SERVICE_UDP_PORT. There is no restriction on the target IP address.

Terms used in this section:

tid - Transaction ID. This is a value composed from the requestor's IP address and a unique 16 bit value generated by the originator of the transaction.

5.1.1. B-NODE ACTIVITY

5.1.1.1. B-NODE ADD NAME

```
PROCEDURE add_name(newname)

/*
    * Host initiated processing for a B node
    */
BEGIN

REPEAT

    /* build name service packet */

ONT = B_NODE; /* broadcast node */
    G = UNIQUE; /* unique name */
    TTL = 0;

5.1.3. M-NODE ACTIVITY
  M nodes behavior is similar to that of P nodes with the addition
  of some B node-like broadcast actions. M node name service
  proceeds in two steps:
  1.Use broadcast UDP based name service. Depending on the
    operation, goto step 2.
   2.Use directed UDP name service.
  The following code for M nodes is exactly the same as for a P
  node, with the exception that broadcast operations are done
  before P type operation is attempted.
   5.1.3.1. M-NODE ADD NAME
  PROCEDURE add_name(newname)
    * Host initiated processing for a M node
  BEGIN
         * check if name exists on the
         * broadcast area
```

```

       END /* case */
   END /* procedure */
5.1.4.2. NBNS TIMER INITIATED PROCESSING
  A NS node uses timers to flush out entries from the data base.
  Each entry in the data base is removed when its timer expires.
  This time value is a multiple of the refresh TTL established when
  the name was registered.
  PROCEDURE timer_expired()
   /*
   * processing initiated by expiration of TTL for a given name
  BEGIN
        * NBNS can (optionally) ensure
         * that the node is actually down
         * by sending a NODE STATUS REQUEST.
         * If such a request is sent, and
         * no response is received, it can
         * be assumed that the node is down.
       remove entry from data base;
  END
```

5.2. SESSION SERVICE PROTOCOLS

The following are variables and should be configurable by the NetBIOS user. The default values of these variables is found in "Defined Constants and Variables" in the Detailed Specification.):

- SSN_RETRY_COUNT The maximum number TCP connection attempts allowable per a single NetBIOS call request.
- SSN_CLOSE_TIMEOUT is the time period to wait when closing the NetBIOS session before killing the TCP connection if session sends are outstanding.

The following are Defined Constants for the NetBIOS Session Service. (See "Defined Constants and Variables" in the Detailed Specification for the value of these constants):

- SSN_SRVC_TCP_PORT - is the globally well-known TCP port allocated for the NetBIOS Session Service. The service accepts TCP connections on this port to establish NetBIOS Sessions. The TCP connection established to this port by the caller is initially used for the exchange of NetBIOS control information. The actual NetBIOS data connection may also pass through this port or, through the retargetting facility, through another port.

5.2.1. SESSION ESTABLISHMENT PROTOCOLS

5.2.1.1. USER REQUEST PROCESSING

```
PROCEDURE listen(listening name, caller name)

/*

* User initiated processing for B, P and M nodes

*

* This procedure assumes that an incoming session will be

* retargetted here by a session server.

*/

BEGIN

Do TCP listen; /* Returns TCP port used */

Register listen with Session Service, give names and

TCP port;

Wait for TCP connection to open; /* Incoming call */

Read SESSION REQUEST packet from connection

Process session request (see section on

processing initiated by the reception of session

service packets);
```

```
Inform Session Service that NetBIOS listen is complete;
     IF session established THEN
          return success and session information to user;
          return failure;
END /* procedure */
PROCEDURE call(calling name, called name)
 ^{\star} user initiated processing for B, P and M nodes
 {}^{\star} This algorithm assumes that the called name is a unique name.
 * If the called name is a group name, the call() procedure
 * needs to cycle through the members of the group
 * until either (retry_count == SSN_RETRY_COUNT) or
 * the list has been exhausted.
 */

END /* procedure */
```

5.2.1.2. RECEIVED PACKET PROCESSING

These are packets received on a TCP connection before a session has been established. The listen routines attached to a NetBIOS user process need not implement the RETARGET response section. The user process version, separate from a shared Session Service, need only accept (POSITIVE SESSION RESPONSE) or reject (NEGATIVE SESSION RESPONSE) a session request.

```
PROCEDURE session_packet(packet)
/*
 * processing initiated by receipt of a session service
 * packet for a session in the session establishment phase.
 * Assumes the TCP connection has been accepted.
 * /
BEGIN
     CASE packet type
        SESSION REQUEST:
          IF called name does not exist on node THEN
          BEGIN
               send NEGATIVE SESSION RESPONSE with CALLED
                    NAME NOT PRESENT error code;
               close TCP connection;
          END
          Search for a listen with CALLING NAME for CALLED
               NAME;
          IF matching listen is found THEN
          BEGIN
               IF port of listener process is port TCP
                  connection is on THEN
               BEGIN
                    send POSITIVE SESSION RESPONSE;
                    Hand off connection to client process
                         and/or inform user session is
                         established;
               END
               ELSE
               BEGIN
                    send RETARGET SESSION RESPONSE with
                         listener's IP address and
                         TCP port;
                    close TCP connection;
               END
          END
          ELSE
          BEGIN
               /* no matching listen pending */
```

```
send NEGATIVE SESSION RESPONSE with either
                       NOT LISTENING ON CALLED NAME or NOT
                       LISTENING FOR CALLING NAME error
                  close TCP connection;
             END
           END /* session request */

             to expire;
        IF time out expired THEN
             abort TCP connection;
  END /* procedure */
5.2.3.2. RECEPTION INDICATION PROCESSING
  PROCEDURE close_indication()
    * initiated by a TCP indication of a close request from
   * the remote connection partner.
```

```
*/
BEGIN
    close gracefully TCP connection;

close NetBIOS session;

inform user session closed by remote partner;
END /* procedure */
```

5.3. NetBIOS DATAGRAM SERVICE PROTOCOLS

The following are GLOBAL variables and should be NetBIOS user configurable:

- SCOPE_ID: the non-leaf section of the domain name preceded by a '.' which represents the domain of the NetBIOS scope for the NetBIOS name. The following protocol description only supports single scope operation.
- MAX_DATAGRAM_LENGTH: the maximum length of an IP datagram. The minimal maximum length defined in for IP is 576 bytes. This value is used when determining whether to fragment a NetBIOS datagram. Implementations are expected to be capable of receiving unfragmented NetBIOS datagrams up to their maximum size.
- BROADCAST_ADDRESS: the IP address B-nodes use to send datagrams with group name destinations and broadcast datagrams. The default is the IP broadcast address for a single IP network.

The following are Defined Constants for the NetBIOS Datagram Service:

- DGM_SRVC_UDP_PORT: the globally well-known UDP port allocated where the NetBIOS Datagram Service receives UDP packets. See section 6, "Defined Constants", for its value.

5.3.1. B NODE TRANSMISSION OF NetBIOS DATAGRAMS

```
IF name type is group name THEN
BEGIN
    group = TRUE;
END
* build datagram service UDP packet;
convert source and destination NetBIOS names into
    half-ASCII, biased encoded name;
SOURCE_NAME = cat(source, SCOPE_ID);
SOURCE_IP = this nodes IP address;
SOURCE_PORT = DGM_SRVC_UDP_PORT;
IF NetBIOS broadcast THEN
    DESTINATION_NAME = cat("*", SCOPE_ID)
END
ELSE
    DESTINATION NAME = cat(destination, SCOPE ID)
END
MSG_TYPE = select_one_from_set
     {BROADCAST, DIRECT_UNIQUE, DIRECT_GROUP}
DGM_ID = next transaction id for Datagrams;
DGM_LENGTH = length of data + length of second level encoded
    source and destination names;
IF (length of the NetBIOS Datagram, including UDP and
   IP headers, > MAX_DATAGRAM_LENGTH) THEN
BEGIN
     * fragment NetBIOS datagram into 2 UDP packets
     Put names into 1st UDP packet and any data that fits
         after names;
     Set MORE and FIRST bits in 1st UDP packet's FLAGS;
     OFFSET in 1st UDP = 0;
     Replicate NetBIOS Datagram header from 1st UDP packet
          into 2nd UDP packet;
     Put rest of data in 2nd UDP packet;
     Clear MORE and FIRST bits in 2nd UDP packet's FLAGS;

  END /* procedure */
5.3.3. RECEPTION OF NetBIOS DATAGRAMS BY ALL NODES
  The following algorithm discards out of order NetBIOS Datagram
  fragments. An implementation which reassembles out of order
  NetBIOS Datagram fragments conforms to this specification. The
  fragment discard timer is initialized to the value FRAGMENT_TO.
  This value should be user configurable. The default value is
  given in Section 6, "Defined Constants and Variables".
  PROCEDURE datagram_packet(packet)
    * processing initiated by datagram packet reception
    * on B, P and M nodes
   * /
  BEGIN
        /*
         * if this node is a P node, ignore
         * broadcast packets.
        IF this is a P node AND incoming packet is
            a broadcast packet THEN
        BEGIN
            discard packet;
       END
        CASE packet type OF
           DATAGRAM SERVICE:
           BEGIN
             IF FIRST bit in FLAGS is set THEN
             BEGIN
                  IF MORE bit in FLAGS is set THEN
                  BEGIN
                       Save 1st UDP packet of the Datagram;
                       Set this Datagram's fragment discard
```

timer to FRAGMENT_TO;

```
return;
     END
     ELSE
          Datagram is composed of a single
            UDP packet;
END
ELSE

          END /* non-broadcast */
         END /* datagram service */
        DATAGRAM ERROR:
        BEGIN
              * name service returned incorrect information
             inform local name service that incorrect
               information was provided;
             IF this is a P or M node THEN
             BEGIN
                   * tell NetBIOS Name Server that it may
                   * have given incorrect information
                  send NAME RELEASE REQUEST with name
                    and incorrect IP address to NetBIOS
                    Name Server;
             END
        END /* datagram error */
     END /* case */
END
```

5.3.4. PROTOCOLS FOR THE NBDD

The key to NetBIOS Datagram forwarding service is the packet delivered to the destination end node must have the same NetBIOS header as if the source end node sent the packet directly to the destination end node. Consequently, the NBDD does not reassemble NetBIOS Datagrams. It forwards the UDP packet as is.

```
PROCEDURE datagram_packet(packet)
 * processing initiated by a incoming datagram service
 * packet on a NBDD node.
BEGIN
     CASE packet type OF
        DATAGRAM SERVICE:
             IF packet was sent as a directed
               NetBIOS datagram THEN
             BEGIN
                * provide group forwarding service
                * Forward datagram to each member of the
                * group. Can forward via:
                    1) get list of group members and send
                    the DATAGRAM SERVICE packet unicast
                    to each
                    2) use Group Multicast, if available
                    3) combination of 1) and 2)
               . . .
             END
             ELSE
             BEGIN
               /*
                * provide broadcast forwarding service
                * Forward datagram to every node in the
                * NetBIOS scope. Can forward via:
                    1) get list of group members and send
                    the DATAGRAM SERVICE packet unicast
                    to each
                    2) use Group Multicast, if available
                    3) combination of 1) and 2)
               . . .
             END
        END /* datagram service */
        DATAGRAM ERROR:
```

```
BEGIN
           * Should never receive these because Datagrams
           * forwarded have source end node IP address and
           * port in NetBIOS header.
          send DELETE NAME REQUEST with incorrect name and
               IP address to NetBIOS Name Server;
        END /* datagram error */
        DATAGRAM QUERY REQUEST:
        BEGIN
          IF can send packet to DESTINATION_NAME THEN
          BEGIN
                * NBDD is able to relay Datagrams for
                * this name
                * /
               send POSITIVE DATAGRAM QUERY RESPONSE to
                 REQUEST source IP address and UDP port
                 with request's DGM_ID;
          END
          ELSE
          BEGIN
                * NBDD is NOT able to relay Datagrams for
                * this name
                * /
               send NEGATIVE DATAGRAM QUERY RESPONSE to
                 REQUEST source IP address and UDP port
                 with request's DGM_ID;
          END
        END /* datagram query request */
     END /* case */
END /* procedure */
```

6. DEFINED CONSTANTS AND VARIABLES

GENERAL:

SCOPE_ID The name of the NetBIOS scope.

This is expressed as a character string meeting the requirements of the domain name system and without a leading or trailing "dot".

An implementation may elect to make this a single global value for the node or allow it to be specified with each separate NetBIOS name (thus permitting cross-scope

references.)

BROADCAST_ADDRESS An IP address composed of the

nodes's network and subnetwork
numbers with all remaining bits set

to one.

I.e. "Specific subnet" broadcast
addressing according to section 2.3

of RFC 950.

BCAST_REQ_RETRY_TIMEOUT 250 milliseconds.

An adaptive timer may be used.

BCAST_REQ_RETRY_COUNT 3

UCAST_REQ_RETRY_TIMEOUT 5 seconds

An adaptive timer may be used.

UCAST_REQ_RETRY_COUNT 3

MAX_DATAGRAM_LENGTH 576 bytes (default)

NAME SERVICE:

REFRESH_TIMER Negotiated with NBNS for each name.

CONFLICT_TIMER 1 second

Implementations may chose a longer

value.

NAME_SERVICE_TCP_PORT 137 (decimal)

NAME_SERVICE_UDP_PORT 137 (decimal)

INFINITE_TTL 0

SESSION SERVICE:

SSN_SRVC_TCP_PORT 139 (decimal)

SSN_RETRY_COUNT 4 (default)

Re-configurable by user.

SSN_CLOSE_TIMEOUT 30 seconds (default)

Re-configurable by user.

SSN_KEEP_ALIVE_TIMEOUT 60 seconds, recommended, may be set to

a higher value.

(Session keep-alives are used only

if configured.)

DATAGRAM SERVICE:

DGM_SRVC_UDP_PORT 138 (decimal)

FRAGMENT_TO 2 seconds (default)
