                    Remote Monitoring MIB Extensions for
                         Differentiated Services

Status of this Memo

Copyright Notice

Abstract

   This memo defines a portion of the Management Information Base (MIB)
   for use with network management protocols in the Internet community.
   In particular, it describes managed objects used for monitoring
   Differentiated Services (DS) Codepoint usage in packets which contain
   a DS field, utilizing the monitoring framework defined in the RMON-2
   (Remote Network Monitoring Management Version 2) MIB.

Table of Contents

1. The SNMP Network Management Framework

   The SNMP Management Framework presently consists of five major
   components:

   o An overall architecture, described in RFC 2571 [RFC2571].

   o Mechanisms for describing and naming objects and events for the
      purpose of management. The first version of this Structure of
      Management Information (SMI) is called SMIv1 and is described in
      STD 16, RFC 1155 [RFC1155], STD 16, RFC 1212 [RFC1212] and RFC
      1215 [RFC1215]. The second version, called SMIv2, is described in
      STD 58, RFC 2578 [RFC2578], RFC 2579 [RFC2579] and RFC 2580
      [RFC2580].

   o Message protocols for transferring management information. The
      first version of the SNMP message protocol is called SNMPv1 and is
      described in STD 15, RFC 1157 [RFC1157]. A second version of the
      SNMP message protocol, which is not an Internet standards track
      protocol, is called SNMPv2c and is described in RFC 1901 [RFC1901]
      and RFC 1906 [RFC1906]. The third version of the message protocol
      is called SNMPv3 and is described in RFC 1906 [RFC1906], RFC 2572
      [RFC2572] and RFC 2574 [RFC2574].

   o Protocol operations for accessing management information. The
      first set of protocol operations and associated PDU formats is
      described in STD 15, RFC 1157 [RFC1157]. A second set of protocol
      operations and associated PDU formats is described in RFC 1905
      [RFC1905].

   o A set of fundamental applications described in RFC 2573 [RFC2573]
      and the view-based access control mechanism described in RFC 2575
      [RFC2575].

   A more detailed introduction to the current SNMP Management Framework
   can be found in RFC 2570 [RFC2570].

   Managed objects are accessed via a virtual information store, termed
   the Management Information Base or MIB. Objects in the MIB are
   defined using the mechanisms defined in the SMI.

   This memo specifies a MIB module that is compliant to the SMIv2. A
   MIB conforming to the SMIv1 can be produced through the appropriate
   translations. The resulting translated MIB must be semantically
   equivalent, except where objects or events are omitted because no
   translation is possible (use of Counter64). Some machine readable
   information in SMIv2 will be converted into textual descriptions in
   SMIv1 during the translation process. However, this loss of machine
   readable information is not considered to change the semantics of the
   MIB.

2. Overview

   There is a need for a standardized way of monitoring the network
   traffic usage of Differentiated Services (DS) [RFC2474] codepoint
   values. Each DS codepoint (DSCP) value may be given a different
   treatment by a forwarding device, and this affects which packets get
   dropped or delayed during periods of network congestion.

   The IETF DIFFSERV working group has redefined the semantics of the
   Type of Service (TOS) octet in the IP header, which is now called the
   'DS field'. The 6-bit Codepoint (DSCP) portion is contained in the
   DS field, which provides for 64 different packet treatments for the
   implementation of differentiated network services.

   By polling DSCP usage counters, an NMS can determine the network
   throughput for traffic associated with different DSCPs. This data
   can then be analyzed in order to 'tune' DSCP 'allocations' within a
   network, based on the Quality of Service (QoS) policies for that
   network.

   Remote monitoring agents are typically implemented as independent
   software (and sometimes hardware) components, called 'RMON probes'.
   Note that DSMON-capable RMON probes simply collect and aggregate
   statistics, based on criteria (which includes the DSCP value) that
   can be determined by inspecting the contents of monitored packets and
   do not in any way monitor any aspect of a DS forwarding device's
   internal statistics.

2.1. Terms

   The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
   "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this
   document are to be interpreted as described in BCP 14, RFC 2119.
   [RFC2119]

   This document uses some terms that need introduction:

   DataSource
      A source of data for monitoring purposes. This term is used
      exactly as defined in the RMON-2 MIB [RFC2021].

   protocol
      A specific protocol encapsulation, as identified for monitoring
      purposes. This term is used exactly as defined in the RMON
      Protocol Identifiers document [RFC2074].

   Counter Aggregation Group
      A group of statistical counters that are being combined in the
      agent to produce one aggregated counter. Refer to sections 3.1
      and 3.2.1 for details on counter aggregation groups.

   Counter Aggregation Profile
      Also called 'profile'; A complete set of counter aggregation group
      mappings for DSCP values (i.e., 64 mappings, for each DSCP values
      0 to 63), which are applied to all monitored packets on a
      particular data source and/or DSMON collection. Refer to sections
      3.1 and 3.2.1 for details on counter aggregation profiles.

   High Capacity Monitoring
      The generic capability to collect and store statistics with an
      internal range of 64 bits (e.g., Counter64). This term does not
      refer to implementation of the High Capacity RMON MIB [RFC3273].

2.2. Relationship to Differentiated Services

   The DSMON MIB is a product of the RMONMIB WG, not the DIFFSERV WG,
   and it focuses on extending several existing RMON mechanisms to
   support additional packet classification, based on DSCP values
   observed in monitored packets. This document assumes the reader is
   familiar with the DS Architecture [RFC2475].

   It is expected that complex management applications will use the
   counters in this MIB to help analyze DS-related throughput. It is
   expected that other metrics, such as delay and jitter, will also be
   analyzed, but support for other metrics is outside the scope of this
   document.

2.3. Relationship to the Remote Monitoring MIBs

   This MIB is intended to be implemented in Remote Monitoring (RMON)
   probes, which support the RMON-2 MIB [RFC2021]. Such probes may be
   stand-alone devices, or may be co-located with other networking
   devices (e.g., ethernet switches and repeaters).

   The DSMON functions are intended to be implemented in conjunction
   with the associated RMON functions, but the MIB is independent of all
   other RMON data tables.

   Several concepts and even MIB objects from the RMON MIBs are used in
   the DSMON MIB:

   Protocol Directory
      The RMON-2 MIB [RFC2021] defines the protocolDirTable, which is a
      directory of all the protocols that the RMON-2 agent is capable of
      decoding and counting. The DSMON MIB utilizes this directory to
      identify the protocols detected in monitored packets. The
      protocolDirLocalIndex MIB object is used to identify protocol
      encapsulations in all DSMON data tables which classify and
      aggregate by protocol type in some manner. Note that the
      protocolDirTable is used for protocol identification only,
      independent of DSCP classification.

   TimeFilter
      The RMON-2 TimeFilter textual convention provides a mechanism to
      retrieve only rows which have been created or modified since the
      last polling interval (for a particular NMS). The DSMON MIB uses
      this textual convention in the large data tables, in order to
      minimize polling impact.

   Zero-Based Counters
      Since counters are instantiated by management action, as in the
      RMON MIBs, the DSMON MIB uses zero-based counters in all data
      collection tables. Specifically, the ZeroBasedCounter32 textual
      convention from the RMON-2 MIB [RFC2021] and the
      ZeroBasedCounter64 textual convention (defined in the HCNUM-TC MIB
      [RFC2856]) are used to define counter objects in this MIB.

   High Capacity Counters
      The DSMON MIB uses the 'SNMPv1 coexistence' strategy adopted by
      the RMONMIB WG. That is, where a 64-bit counter is provided, a
      32-bit version of the counter, and a 32-bit overflow counter are
   also provided.

   TopN Reports
      The DSMON MIB uses the same TopN reporting MIB structure as the
      RMON-2 MIB [RFC2021]. TopN reporting can greatly reduce the
      polling overhead required to analyze DSCP usage patterns.

   Some DESCRIPTION clauses for DSMON objects are very similar to those
   for existing RMON-2 or HC-RMON objects. This is intentional, since
   the semantics of the DSMON features are designed to be as close to
   existing RMON feature as possible, to allow developers and users some
   level of 'MIB re-use'.

3. MIB Structure

                  Figure 1: DSMON MIB Functional Structure

```
        +--------------+   +---------------+
        |              |   |    Counter    |
        |    DSMON     |   |  Aggregation  |
        | Capabilities |   |    Control    |
        |              |   |               |
        +--------------+   +---------------+
                                  |
                                  |
     +----------------------------+--------------------------+
     |                            V                          |
     |                                                       |
     |  +----------+ +----------+ +----------+ +-----------+ |
     |  |          | |          | |          | |           | |
     |  | Data Src | | Protocol | | Net. Host| | App Matrix| |
     |  |   Stats  | |   Stats  | |   Stats  | |    Stats  | |
     |  |          | |          | |          | |           | |
     |  +----------+ +----------+ +----------+ +-----------+ |
     |                    |            |            |        |
     |                    V            V            V        |
     |               +----------+ +----------+ +-----------+ |
     |               |          | |          | |           | |
     |               | Protocol | | Net. Host| | App Matrix| |
     |               |   TopN   | |   TopN   | |    TopN    | |
     |               |          | |          | |           | |
     |               +----------+ +----------+ +-----------+ |
     |                                                       |
     |                    Data Collection                   |
     |                                                       |
     +-------------------------------------------------------+
```

The DSMON MIB can divided into three functional components:

- DSMON Capabilities
  Describes which DSMON object groups are supported by the agent on
  at least one data source.

- Counter Aggregation Control
  Controls how individual DIFFSERV codepoint counters are aggregated
  in DSMON data collections.

- Data Collection
  Controls how individual statistical collections are maintained by
  the agent and reported to management applications. The individual
  boxes within the Data Collection box represent the DSMON data
  collections (described in section 3.2):

    - Data Source Statistics
    - Protocol Statistics
    - Protocol Statistics TopN Reporting
    - Network Protocol Host Statistics
    - Network Protocol Host Statistics TopN Reporting
    - Application Protocol Matrix Statistics
    - Application Protocol Matrix Statistics TopN Reporting

3.1. DSCP Counter Aggregation

   A mechanism to configure the agent to internally aggregate counters
   is provided, based on DSCP values. This is desirable for several
   reasons:

   - agent data reduction
     An agent implementation can potentially reduce the number of
     counters maintained for a given DSMON collection.

   - agent data collection limitations
     Some implementation strategies might provide for a limited number
     of high-speed (e.g., hardware-based) counters for either single or
     aggregated codepoints.

   - application data retrieval reduction
     Applications that would otherwise aggregate counters for
     individual codepoints can move that function to the agent in order
     to reduce the polling overhead on the application, the network,
     and the agent device.

   - some unused codepoints at this time
     Various DSCP values may be expected to remain unused on a given
     network, and may be aggregated for counting purposes.

- some DSCP values are mapped to the same packet treatment
  A network administrator may align the counter aggregation
  configuration of the monitoring device with the DS configuration,
  and aggregate statistics for DSCP values which are expected to
  receive the same treatment by the forwarding devices.

3.1.1. Counter Aggregation Configuration

  The configuration of DSCP counter to counter aggregation group
  mappings is managed in a global manner, so that these settings can be
  shared across several DSMON collections and/or data sources. One
  complete set of DSCP counter mappings is called a counter aggregation
  profile. The DSMON control tables are very similar to existing
  RMON-2 control tables, except they contain an extra parameter to
  identify the counter aggregation profile the agent should use for the
  collection.

  The appropriate granularity for counter aggregation profile
  assignment may be the data source, but in order to reduce MIB
  complexity (by avoiding an extra layer of tables), an instance of the
  counter aggregation profile parameter exists for each collection. An
  agent MAY choose to restrict configurations such that all DSMON data
  collections for the same data source must use the same counter
  aggregation profile.

  The DSMON MIB supports the configuration of an arbitrary number of
  counter aggregation profiles. There is a top-level counter
  aggregation control table, which contains one entry for each counter
  aggregation profile. A subordinate counter aggregation profile table
  provides information about each DSCP counter to counter aggregation
  group mapping in each profile. An auxiliary counter aggregation
  group table also provides descriptive information about each counter
  aggregation group in each profile. Refer to section 3.2.1 for
  details on these MIB objects.

3.2. MIB Group Overview

  The DSMON MIB contains six groups of MIB objects:

  - dsmonAggregateControl group
    Controls the configuration of counter aggregation groups for the
    purpose of reducing the total number of counters maintained by the
    agent.

  - dsmonStatsObjects group
    Report per counter aggregation group distribution statistics for a
    particular RMON dataSource.

   - dsmonPdistObjects group
      Report per counter aggregation group distribution statistics for
      each application protocol detected on a particular RMON
      dataSource.

   - dsmonHostObjects group
      Report host address distribution statistics for each counter
      aggregation group, detected on a particular RMON dataSource.

   - dsmonCapsObjects group
      Report the static DSMON MIB functional capabilities of the agent
      implementation.

   - dsmonMatrixObjects group
      Report host address pair distribution statistics for each counter
      aggregation group, detected on a particular RMON dataSource.

3.2.1. DSCP Counter Aggregation Control Group

   This group contains 4 scalar objects and three tables, and is used by
   a management station to configure counter aggregation profiles.

   The dsmonMaxAggGroups scalar is a read-only integer which indicates
   the maximum number of counter aggregation groups that the agent will
   allow to be configured into a single aggregation profile. This value
   SHOULD be equal to 64 (the number of codepoints), but an agent MAY
   limit the number of counter aggregation groups because of resource
   limitations (e.g., small number of hardware-based counters). At
   least one counter aggregation profile containing at least two counter
   aggregation groups SHOULD be supported by the agent. (Note that
   classifying all DSCP counters into the same statistical 'bucket' may
   yield a redundant data collection, which can be achieved more easily
   with an HC-RMON or RMON-2 collection instead.)

   The dsmonAggControlLocked scalar is used as a top level switch,
   controlling most write access to the dsmonAggControlTable,
   dsmonAggProfileTable, and dsmonAggGroupTable. (The
   dsmonAggControlOwner object is the only exception.) All active DSMON
   collection data is deleted, and collection suspended, while this
   object is equal to 'false', since the meaning of one or more counter
   aggregation control tables may change when it is set back to 'true'.

   The dsmonAggControlChanges counter and dsmonAggControlLastChangeTime
   timestamp can be used by a management station to detect that the
   codepoint to counter aggregation group mappings may have changed
   between polls.

The dsmonAggControlTable is a read-create table which contains one
entry for each counter aggregation profile configured on the agent.
Each entry is identified by a dsmonAggControlIndex value, which is
also used as the major index into the dsmonAggProfileTable and
dsmonAggGroupTable. The DSMON control tables with DataSource objects
select a counter aggregation profile by referencing this index value.

The dsmonAggProfileTable is a read-write table which contains 64 rows
for each associated entry in the dsmonAggControlTable, which MUST be
indexed from 0 to 63. The agent creates this set of 64 instances
when the associated dsmonAggControlEntry is activated, and deletes
them when that dsmonAggControlEntry is deactivated. Each of the 64
rows represents a conceptual DSCP counter, identified by the same
dsmonAggProfileDSCP value, and contains the DSCP counter to counter
aggregation group mapping for that DSCP counter, in the indicated
profile. The agent SHOULD use the value zero as the initial counter
aggregation group assignment for each entry in this table.

The dsmonAggGroupTable contains an administratively assigned
descriptive label for each configured counter aggregation group.
This table is not required to be fully configured in order for data
collection to occur, since collections are identified by the agent
with integer indices. It is provided to allow the agent to store a
descriptive string for each configured counter aggregation group.
There is no attempt made to convey any real semantics for each
counter aggregation group. A management station MAY choose not to
configure entries in this table.

3.2.2. DS Statistics Group

This group contains two tables, the dsmonStatsControlTable and the
dsmonStatsTable, and supports counter aggregation group distribution
statistics for half and full-duplex, low and high speed interfaces.
Packet and octets distributions are maintained in the dsmonStatsTable
for each active control row in the dsmonStatsControlTable.

This group provides the lowest statistics granularity in the DSMON
MIB. It is expected that a management application will analyze
certain DS deployment or performance problems by first examining the
counter aggregation group distribution for an entire data source with
this group.

3.2.3. DS Protocol Distribution Group

This group contains two tables for statistics collection,
(dsmonPdistCtlTable and dsmonPdistStatsTable), and two tables for a
'Top N' reporting function for the collected statistics
(dsmonPdistTopNCtlTable and dsmonPdistTopNTable).

   The dsmonPdistCtlTable and dsmonPdistStatsTable tables provide
   counter aggregation group distribution statistics for each selected
   protocol encapsulation in packets monitored on a particular
   dataSource. Packet and octets distributions (per counter aggregation
   group per protocol) are maintained in the dsmonPdistStatsTable for
   each active control row in the dsmonPdistCtlTable.

   Due to the potentially large number of entries, the DS Protocol
   Distribution is different from the RMON-2 protocol distribution group
   in several ways:

   - maximum desired entries parameter added to the control table

   - inserts and deletes counters added to the control table

   - support for LRU garbage collection in the dsmonPdistStatsTable

   - TimeFilter index added to the dsmonPdistStatsTable

   - the selection of protocols is not configurable. Rather than
      select individual protocols to monitor, (e.g., via a
      'supportedOn/Off' extension to the protocolDirTable [RFC 2021]), a
      simplified configuration mechanism is provided. Since DSCP usage
      statistics are most interesting at the application layer, the
      dsmonPdistStatsTable is 'hardwired' to select only application
      layer (i.e., 'terminal') protocols for statistical analysis.

   The TopN feature requires two additional tables: the
   dsmonPdistTopNCtlTable and the dsmonPdistTopNTable, and supports
   periodic usage reporting for the statistics maintained in the
   dsmonPdistStatsTable. This feature allows for simple periodic
   retrieval of the most used application/counter aggregation group
   combinations.

3.2.4. DS Host Distribution Group

   This group contains two tables for statistics collection,
   (dsmonHostCtlTable and dsmonHostTable), and two tables for a 'Top N'
   reporting function for the collected statistics
   (dsmonHostTopNCtlTable and dsmonHostTopNTable).

   The dsmonHostCtlTable and dsmonHostTables provide host distribution
   statistics for each counter aggregation group detected in packets
   monitored on a particular dataSource. The DSMON Host collection is
   similar to the RMON-2 network layer host collection (nlHostTable).
   There is no DSMON application host table defined at this time.

It is expected that a management application will analyze certain DS
deployment or performance problems by first determining the high
priority DSCP values to examine (beyond the scope of this document)
and then examining the dsmonHostTable or dsmonHostTopNTable
statistics to determine which hosts are using the selected counter
aggregation groups.

Packet and octets distributions (in and out, per counter aggregation
group per host) are maintained in the dsmonHostTable for each active
control row in the dsmonHostCtlTable.

The DS Host Distribution is different from the RMON-2 network layer
host group in two ways:

- the protocolDirLocalIndex in the INDEX clause MUST identify a
   network protocol encapsulation which contains a DS field (e.g.,
   IPv4 or IPv6). If a protocol encapsulation with multiple network
   layers is specified, then associated entries in this table refer
   to the innermost network protocol layer.

- the dsmonHostCtlTable supports limited IPv4 and IPv6 prefix
   aggregation by allowing the number of 'monitored address bits' in
   each address to be configured for each collection. The agent will
   zero out the selected number of rightmost address bits for
   counting purposes. This configuration parameter can dramatically
   reduce the number of entries which must be maintained by the
   agent, which should reduce CPU and memory resource requirements on
   the agent, and reduce polling overhead on the network and the
   management station. However, only one mask can be configured for
   each address type, rather than multiple different length masks for
   each address type, based on prefix value.

The TopN feature requires two additional tables: the
dsmonHostTopNCtlTable and the dsmonHostTopNTable, and supports
periodic usage reporting for the statistics maintained in the
dsmonHostTable. This feature allows for simple periodic retrieval of
the most used IP-host/DSCP combinations.

3.2.5. DSMON Capabilities Group

This group contains a single read-only scalar object,
dsmonCapabilities, which provides an indication of the MIB groups
within this MIB that the agent supports.

3.2.6. DS Matrix Distribution Group

   This group contains three tables for statistics collection,
   (dsmonMatrixCtlTable, dsmonMatrixSDTable, and dsmonMatrixDSTable),
   and two tables for a 'Top N' reporting function for the collected
   statistics (dsmonMatrixTopNCtlTable and dsmonMatrixTopNTable).

   The dsmonMatrixCtlTable, dsmonMatrixSDTable, and dsmonMatrixDSTable
   provide host-pair distribution statistics for each counter
   aggregation group detected in packets monitored on a particular
   dataSource. The DSMON Matrix collection is similar to the RMON-2
   application layer matrix collection (alMatrixSDTable and
   alMatrixDSTable). There is no DSMON network layer matrix table
   defined at this time.

   It is expected that a management application will analyze certain DS
   deployment or performance problems by first determining the high
   priority DSCP values to examine (beyond the scope of this document)
   and then examining the dsmonMatrixSDTable, dsmonMatrixDSTable, and/or
   dsmonMatrixTopNTable statistics to determine which host-pairs are
   using the selected counter aggregation groups.

   Packet and octets distributions (source to destination, per counter
   aggregation group per host-pair) are maintained in the
   dsmonMatrixSDTable and dsmonMatrixDSTable for each active control row
   in the dsmonMatrixCtlTable.

   The TopN feature requires two additional tables: the
   dsmonMatrixTopNCtlTable and the dsmonMatrixTopNTable, and supports
   periodic usage reporting for the statistics maintained in the
   dsmonMatrixSDTable. This feature allows for simple periodic
   retrieval of the most used IP-host-pair/DSCP combinations.

3.3. RMON vs. DSMON Indexing Structure

   The DSMON-MIB control and data tables are very similar in structure
   and look-and-feel to existing RMON-2 and HC-RMON control tables for
   the comparable feature, in order to maintain consistent agent
   behavior and functionality across RMON MIBs. The DSMON data tables
   are indexed as closely as possible to the comparable RMON-2 or HC-
   RMON tables, with the addition of an index component for DSCP-based
   classification (i.e. dsmonAggGroup). Refer to Table 1 for a
   comparison of DSMON indexing structure with similar existing RMON
   features.

                     Table 1: DSMON Indexing Comparison

          Existing RMON   DSMON

                      Full Duplex Interface Statistics

    mediaIndependentEntry | dsmonStatsControlEntry
       mediaIndependentIndex | dsmonStatsControlIndex
                                        | dsmonStatsEntry
                                        | dsmonStatsControlIndex,
                                        | dsmonAggGroupIndex
    --------------------------------+-------------------------------

dsmonMaxAggGroups OBJECT-TYPE
    SYNTAX   Integer32 (2..64)
    MAX-ACCESS read-only
    STATUS   current
    DESCRIPTION
            "The maximum number of counter aggregation groups that this
            agent can support. The agent will allow this number of
            distinct groups to be configured in the
            dsmonAggProfileTable, numbered from '0' to
            'dsmonMaxAggGroups - 1', for each counter aggregation
            profile entry supported by the agent.

            The agent MUST NOT lower this value during system operation,
            and SHOULD set this object to an appropriate value during
            system initialization."
    ::= { dsmonAggObjects 1 }

dsmonAggControlLocked OBJECT-TYPE
    SYNTAX   TruthValue
    MAX-ACCESS read-write
    STATUS   current
    DESCRIPTION
            "Controls the setup of counter aggregation groups for this
            agent.

            If this object contains the value 'true', then write access
            to the objects in the dsmonAggControlTable (except the
            dsmonAggControlOwner object), dsmonAggProfileTable, and
            dsmonAggGroupTable is not permitted, and data collection is
            possible. This object only controls write access to these
            MIB objects. The DSMON data collection control tables
            (e.g., dsmonHostCtlTable) can be configured at any time,
            regardless of the value of this object.

            If this object contains the value 'false', write access to
            the objects in the dsmonAggControlTable,
            dsmonAggProfileTable, and dsmonAggGroupTable is permitted,
            and data collection is not possible. In addition, all
            objects in all DSMON data tables (e.g., dsmonStatsTable)
            shall be deleted.

            An agent is not required to process SNMP Set Requests for
            this object in conjunction with other objects from this MIB.
            This is intended to simplify the processing of Set Requests
            for tables such as the dsmonAggProfileTable, by eliminating
            the possibility that a single Set PDU will contain multiple
            varbinds which are in conflict, such as a PDU which both
            modifies the dsmonAggProfileTable and locks the

                dsmonAggProfileTable at the same time.

                Note that the agent is not required to validate the entire
                counter aggregation configuration when an attempt is made to
                transition an instance of this object from 'true' to
                'false'. That validation is done if and when a DSMON data
                collection is activated.

                An agent is required to reactivate any suspended data
                collections when this object transitions to 'true', Each
                active data control entry (e.g., dsmonStatsControlEntry),
                will be validated with respect to the new counter
                aggregation configuration. If the counter aggregation
                profile referenced in the data collection is valid, then
                that collection will be restarted. Otherwise, the RowStatus
                object (e.g., dsmonStatsControlStatus) will be set to
                'notReady' for that collection control entry."
        ::= { dsmonAggObjects 2 }

    dsmonAggControlChanges OBJECT-TYPE
        SYNTAX   Counter32
        MAX-ACCESS   read-only
        STATUS   current
        DESCRIPTION
                "This object counts the number of times the value of the
                dsmonAggControlLocked object has changed. A management
                station can use this object to detect if counters in the
                DSMON data tables (e.g., dsmonStatsEntry) have been deleted
                and recreated between polls.

                This object shall be incremented by one each time the
                dsmonAggControlLocked object changes from 'false' to 'true',
                or from 'true' to 'false'."
        ::= { dsmonAggObjects 3 }

    dsmonAggControlLastChangeTime OBJECT-TYPE
        SYNTAX   TimeStamp
        MAX-ACCESS   read-only
        STATUS   current
        DESCRIPTION
                "This object identifies the value of sysUpTime at the moment
                the dsmonAggControlLocked object was last modified. A
                management station can use this object to detect if counters
                in the DSMON data tables (e.g., dsmonStatsEntry) have been
                deleted and recreated between polls.

                This object shall be updated with the current value of
                sysUpTime, if the dsmonAggControlLocked object changes from

              'false' to 'true', or from 'true' to 'false'.

              Upon system initialization, this object shall contain the
              value zero."
      ::= { dsmonAggObjects 4 }

--
-- Counter Aggregation Control Table
--

dsmonAggControlTable OBJECT-TYPE
     SYNTAX   SEQUENCE OF DsmonAggControlEntry
     MAX-ACCESS   not-accessible
     STATUS   current
     DESCRIPTION
             "This table provides an overall description and control
             point for all dsmonAggProfileEntries with the same
             dsmonAggControlIndex value.

             A management application SHOULD create a counter aggregation
             profile by first creating and activating an entry in this
             table. This will cause the agent to create a set of 64
             dsmonAggProfileEntries on behalf of this control entry. An
             application can then set the individual counter aggregation
             group assignments for each of the 64 DSCP values,

             This table MUST NOT be modified if the dsmonAggControlLocked
             object is equal to 'true'.

             Note that an agent MAY choose to limit the actual number of
             entries which may be created in this table, and
             (independently) the number of counter aggregation profiles
             which may be applied to a particular data source. In this
             case, the agent SHOULD return an error-status of
             'resourceUnavailable(13)', as per section 4.2.5 of the
             'Protocol Operations for SNMPv2' specification [RFC1905].

             The agent SHOULD support non-volatile configuration of this
             table, and upon system initialization, the table SHOULD be
             initialized with the saved values. Otherwise, each
             potential counter aggregation group description string
             SHOULD contain the empty string."

    MAX-ACCESS  not-accessible
    STATUS       current
    DESCRIPTION
```

"A list of information on Differentiated Services DSCP
usage, containing packet and octet counters for each counter
aggregation group configured for collection, and each
protocol (as identified by the protocolDirLocalIndex for the
protocol) identified in each monitored packet.

The dsmonPdistCtlIndex value in the index identifies the
dsmonPdistCtlEntry on whose behalf this entry was created.

Note that only packets that contain a network protocol
encapsulation which contains a DS field [RFC2474] will be
counted in this table.

The dsmonAggGroupIndex value in the index is determined by
examining the DSCP value in each monitored packet, and the
dsmonAggProfileTable entry for that value.

The protocolDirLocalIndex in the index identifies the
protocolDirEntry for the protocol encapsulation of each
monitored packet. The agent will include only application
layer protocols in the associated dsmonPdistStatsTable. Any
'terminal' protocol is considered to be an application
protocol.

An example of the indexing of this entry is
dsmonPdistStatsPkts.9.29943.0.42."

the agent supports High Capacity monitoring.

This object MUST NOT be modified if the associated
dsmonPdistTopNCtlStatus object is equal to active(1)."
::= { dsmonPdistTopNCtlEntry 3 }

dsmonPdistTopNCtlTimeRemaining OBJECT-TYPE
    SYNTAX   Integer32 (0..2147483647)
    UNITS   "seconds"
    MAX-ACCESS read-create
    STATUS   current
    DESCRIPTION
            "The number of seconds left in the report currently being
            collected. When this object is modified by the management
            station, a new collection is started, possibly aborting a
            currently running report. The new value is used as the
            requested duration of this report, and is immediately loaded
            into the associated dsmonPdistTopNCtlDuration object.

            When the report finishes, the probe will automatically start
            another collection with the same initial value of
            dsmonPdistTopNCtlTimeRemaining. Thus the management station
            may simply read the resulting reports repeatedly, checking
            the startTime and duration each time to ensure that a report
            was not missed or that the report parameters were not
            changed.

            While the value of this object is non-zero, it decrements by
            one per second until it reaches zero. At the time that this
            object decrements to zero, the report is made accessible in
            the dsmonPdistTopNTable, overwriting any report that may be
            there.

```
              When this object is modified by the management station, any
              associated entries in the dsmonPdistTopNTable shall be
              deleted."

dsmonHostTable OBJECT-TYPE
    SYNTAX      SEQUENCE OF DsmonHostEntry
    MAX-ACCESS  not-accessible
    STATUS      current
    DESCRIPTION
            "A collection of statistics for particular network protocols
            which contain a DS field, and that has been discovered on a
            particular dataSource.

            The probe will add to this table all appropriate network
            protocols, for each network address seen as the source or
            destination address in all packets with no MAC errors, and
            will increment octet and packet counts in the table for all
            packets with no MAC errors.

            If the dsmonAggControlLocked object is equal to 'false',
            then all entries in this table will be deleted, and the
            agent will not process packets on behalf of any
            dsmonHostCtlEntry."
    ::= { dsmonHostObjects 2 }

dsmonHostEntry OBJECT-TYPE
    SYNTAX      DsmonHostEntry
    MAX-ACCESS  not-accessible
    STATUS      current
```

         DESCRIPTION
                 "A list of information on Differentiated Services DSCP
                 usage, containing packet and octet counters for each counter
                 aggregation group index configured for collection per host
                 address, as identified in the dsmonAggProfileTable.

                 The dsmonHostCtlIndex value in the index identifies the
                 dsmonHostCtlEntry on whose behalf this entry was created.

                 The protocolDirLocalIndex value in the index identifies the
                 specific network layer protocol encapsulation associated
                 with each entry, and the network protocol type of the
                 dsmonHostAddress object. It MUST identify a
                 protocolDirEntry which contains a DS field (e.g., IPv4 or
                 IPv6). Note that if a protocol encapsulation with multiple
                 network layers is specified, then associated entries in this
                 table refer to the innermost network protocol layer host
                 address.

                 The dsmonAggGroupIndex value in the index is determined by
                 examining the DSCP value in each monitored packet, and the
                 dsmonAggProfileTable entry configured for that value.

                 An example of the indexing of this entry is
                 dsmonHostOutPkts.1.27273.3.200.4.171.69.120.0"

            dsmonHostTopNOutOctets    dsmonHostOutOctets
            dsmonHostTopNTotalPkts    dsmonHostInPkts +
                                         dsmonHostOutPkts
            dsmonHostTopNTotalOctets  dsmonHostInOctets +
                                         dsmonHostOutOctets
            dsmonHostTopNInHCPkts     dsmonHostInHCPkts
            dsmonHostTopNInHCOctets   dsmonHostInHCOctets
            dsmonHostTopNOutHCPkts    dsmonHostOutHCPkts
            dsmonHostTopNOutHCOctets  dsmonHostOutHCPkts
            dsmonHostTopNTotalHCPkts  dsmonHostInHCPkts +
                                         dsmonHostOutHCPkts
            dsmonHostTopNTotalHCOctets dsmonHostInHCOctets +
                                         dsmonHostOutHCOctets

            The following enumerations are only available if the agent
            supports High Capacity monitoring:

            dsmonHostTopNInHCPkts
            dsmonHostTopNInHCOctets
```

```
            dsmonHostTopNOutHCPkts
            dsmonHostTopNOutHCOctets
            dsmonHostTopNTotalHCPkts
            dsmonHostTopNTotalHCOctets

            It is an implementation-specific matter whether an agent can
            detect an overflow condition resulting from the addition of
            two counter delta values for the following enumerations:

            dsmonHostTopNTotalPkts
            dsmonHostTopNTotalOctets
            dsmonHostTopNTotalHCPkts
            dsmonHostTopNTotalHCOctets

            In the event such an overflow condition can be detected by
            the agent, the associated dsmonHostTopNRate,
            dsmonHostTopNRateOvfl, and/or dsmonHostTopNHCRate objects
            should be set to their maximum value.

            This object MUST NOT be modified if the associated
            dsmonHostTopNCtlStatus object is equal to active(1)."
    ::= { dsmonHostTopNCtlEntry 3 }

dsmonHostTopNCtlTimeRemaining OBJECT-TYPE
    SYNTAX      Integer32 (0..2147483647)
    UNITS       "seconds"
    MAX-ACCESS read-create
    STATUS      current
    DESCRIPTION
            "The number of seconds left in the report currently being
            collected.  When this object is modified by the management
            station, a new collection is started, possibly aborting a
            currently running report.  The new value is used as the
            requested duration of this report, and is immediately loaded
            into the associated dsmonHostTopNCtlDuration object.

            When the report finishes, the probe will automatically start
            another collection with the same initial value of
            dsmonHostTopNCtlTimeRemaining.  Thus the management station
            may simply read the resulting reports repeatedly, checking
            the startTime and duration each time to ensure that a report
            was not missed or that the report parameters were not
            changed.

            While the value of this object is non-zero, it decrements by
            one per second until it reaches zero.  At the time that this
            object decrements to zero, the report is made accessible in
            the dsmonHostTopNTable, overwriting any report that may be
```

```
            there.

            When this object is modified by the management station, any
            associated entries in the dsmonHostTopNTable shall be
            deleted."

            probe will not create more than this number of associated
            entries in these tables, but may choose to create fewer
            entries in this table for any reason including the lack of
            resources.

            If this value is set to -1, the probe may create any number
            of entries in this table.

            This object MUST NOT be modified if the associated
            dsmonMatrixCtlStatus object is equal to active(1)."
    ::= { dsmonMatrixCtlEntry 4 }

dsmonMatrixCtlDroppedFrames OBJECT-TYPE
    SYNTAX   Counter32
    UNITS   "frames"
    MAX-ACCESS   read-only
    STATUS   current
    DESCRIPTION
            "The total number of frames which were received by the probe
            and therefore not accounted for in the *StatsDropEvents, but
            for which the probe chose not to count for the associated
            dsmonMatrixSD and dsmonMatrixDS entries for whatever reason.
            Most often, this event occurs when the probe is out of some
            resources and decides to shed load from this collection.

            This count does not include packets that were not counted
            because they had MAC-layer errors.

            Note that if the dsmonMatrix tables are inactive because no
            appropriate protocols are enabled in the protocol directory,
            this value SHOULD be 0.

            Note that, unlike the dropEvents counter, this number is the
            exact number of frames dropped."

    DESCRIPTION
            "A set of parameters that control the creation of a report
            of the top N dsmonMatrix entries according to a selected
            metric.

            Note that an agent MAY choose to limit the actual number of
            entries which may be created in this table. In this case,
            the agent SHOULD return an error-status of
            'resourceUnavailable(13)', as per section 4.2.5 of the
            'Protocol Operations for SNMPv2' specification [RFC1905]."
    ::= { dsmonMatrixObjects 4 }

dsmonMatrixTopNCtlEntry OBJECT-TYPE
    SYNTAX   DsmonMatrixTopNCtlEntry
    MAX-ACCESS   not-accessible
    STATUS   current
    DESCRIPTION
            "A conceptual row in the dsmonMatrixTopNCtlTable.

            Entries are created and deleted from this table by
            management action only, using the dsmonMatrixTopNCtlStatus
            RowStatus object.

            The agent SHOULD support non-volatile configuration of this
            table, and upon system initialization, the table SHOULD be
            initialized with the saved values.

            Activation of a control row in this table will cause an
            associated dsmonMatrixTopNTable to be created and maintained
            by the agent."

            }
    MAX-ACCESS  read-create
    STATUS      current
    DESCRIPTION
            "The variable for each dsmonMatrixSD entry that the
            dsmonMatrixTopNRate and dsmonMatrixTopNHCRate variables are
            based upon.  Each dsmonMatrixTopN report generated on behalf
            of this control entry will be ranked in descending order,
            based on the associated dsmonMatrixSDTable counter,
            identified by this object.

            The following table identifies the dsmonMatrixSDTable
            counters associated with each enumeration:

            Enumeration                  RateBase MIB Objects
```

```
          -----------               --------------------
          dsmonMatrixTopNPkts       dsmonMatrixSDPkts
          dsmonMatrixTopNOctets     dsmonMatrixSDOctets
          dsmonMatrixTopNHCPkts     dsmonMatrixSDHCPkts
          dsmonMatrixTopNHCOctets   dsmonMatrixSDHCOctets

          The following enumerations are only available if the agent
          supports High Capacity monitoring:

          dsmonMatrixTopNHCPkts
          dsmonMatrixTopNHCOctets

          This object MUST NOT be modified if the associated
          dsmonMatrixTopNCtlStatus object is equal to active(1)."
     ::= { dsmonMatrixTopNCtlEntry 3 }

dsmonMatrixTopNCtlTimeRemaining OBJECT-TYPE
     SYNTAX     Integer32 (0..2147483647)
     UNITS      "seconds"
     MAX-ACCESS read-create
     STATUS     current
     DESCRIPTION
          "The number of seconds left in the report currently being
          collected.  When this object is modified by the management
          station, a new collection is started, possibly aborting a
          currently running report.  The new value is used as the
          requested duration of this report, and is immediately loaded
          into the associated dsmonMatrixTopNCtlDuration object.

          When the report finishes, the probe will automatically start
          another collection with the same initial value of
          dsmonMatrixTopNCtlTimeRemaining.  Thus the management
          station may simply read the resulting reports repeatedly,
          checking the startTime and duration each time to ensure that
          a report was not missed or that the report parameters were
          not changed.

          While the value of this object is non-zero, it decrements by
          one per second until it reaches zero.  At the time that this
          object decrements to zero, the report is made accessible in
          the dsmonMatrixTopNTable, overwriting any report that may be
          there.

          When this object is modified by the management station, any
          associated entries in the dsmonMatrixTopNTable shall be
          deleted."

5. Counter Aggregation Configuration Usage Examples

   This section contains an example of the steps that may be followed by
   a management station to configure the objects in the
   dsmonCounterAggControlGroup.

   A note about these examples:

   - they do not define a standard

   - an agent is not obligated to support them

   - a management application is not constrained by them

   - the SET(object = value [, ...]) notation is only conceptual, and
      is not meant to represent an actual SNMP Set PDU.

5.1. Step 1: Unlock the Counter Aggregation Configuration

   Before any write operations to the tabular objects in this group can
   be made, the counter aggregation configuration must be unlocked by
   setting the dsmonAggControlLocked scalar to false:

      SET(dsmonAggControlLocked.0 = false(2));

5.2. Step 2: Check the Maximum number of Counter Aggregation Groups

   Make sure the desired counter aggregation groups have a chance of
   being configured on the agent.

      maxGroups = GET(dsmonAggMaxAggGroups.0);

   For this example, maxGroups is greater or equal to 64.

5.3. Step 3: Check if the counter aggregation profiles already exist

   Make sure the desired counter aggregation profiles have not already
   been configured, or perhaps recreated after an agent restart. The
   following example is oversimplified, in that the entire counter
   aggregation configuration should actually be verified.

      profile1Descr = GET(dsmonAggControlDescr.1);
      profile1Owner = GET(dsmonAggControlOwner.1);
      profile1Status = GET(dsmonAggControlStatus.1);

   For this example, none of the counter aggregation profiles already
   exist.

5.4. Step 4: Create the Counter Aggregation Control Entries

   The management station should create one entry in the
   dsmonAggControlTable for each counter aggregation profile to be
   configured on the agent.

   Steps 4, 5, and 6 are repeated for each counter aggregation profile
   to be configured on the agent. There are 3 example counter
   aggregation profiles shown in each of these steps.

   Example 1: Each DSCP in its own counter aggregation group.

      SET(dsmonAggControlStatus.1 = createAndGo(4),
          dsmonAggControlOwner.1 = "Example App 1",
          dsmonAggControlDescr.1 = "1 DSCP Per Group");

   Example 2: a collection of DIFFSERV PHBs.

      SET(dsmonAggControlStatus.2 = createAndGo(4),
          dsmonAggControlOwner.2 = "Example App 2",
          dsmonAggControlDescr.2 = "June 2000 DIFFSERV PHBs");

   Example 3: an aggregated collection of DIFFSERV PHBs.

      SET(dsmonAggControlStatus.3 = createAndGo(4),
          dsmonAggControlOwner.3 = "Example App 3",
          dsmonAggControlDescr.3 = "Limited June 2000 PHBs");

5.5. Step 5: Create the Counter Aggregation Group Descriptions

   Example 1: Each DSCP in its own counter aggregation group. One group
   is created for each codepoint, for a total of 64 rows.

      SET(dsmonAggGroupStatus.1.0 = createAndGo(4),
          dsmonAggGroupDescr.1.0 = "DSCP 0");
      SET(dsmonAggGroupStatus.1.1 = createAndGo(4),
          dsmonAggGroupDescr.1.1 = "DSCP 1");
      SET(dsmonAggGroupStatus.1.2 = createAndGo(4),
          dsmonAggGroupDescr.1.2 = "DSCP 2");
      SET(dsmonAggGroupStatus.1.3 = createAndGo(4),
          dsmonAggGroupDescr.1.3 = "DSCP 3");

      ...

      SET(dsmonAggGroupStatus.1.63 = createAndGo(4),
          dsmonAggGroupDescr.1.63 = "DSCP 63");

   Example 2: a collection of current DIFFSERV PHBs. One group is
   created for each PHB to be monitored.

```
    SET(dsmonAggGroupStatus.2.0 = createAndGo(4),
        dsmonAggGroupDescr.2.0 = "CS0");
    SET(dsmonAggGroupStatus.2.1 = createAndGo(4),
        dsmonAggGroupDescr.2.1 = "CS1");
    SET(dsmonAggGroupStatus.2.2 = createAndGo(4),
        dsmonAggGroupDescr.2.2 = "CS2");
    SET(dsmonAggGroupStatus.2.3 = createAndGo(4),
        dsmonAggGroupDescr.2.3 = "CS3");
    SET(dsmonAggGroupStatus.2.4 = createAndGo(4),
        dsmonAggGroupDescr.2.4 = "CS4");
    SET(dsmonAggGroupStatus.2.5 = createAndGo(4),
        dsmonAggGroupDescr.2.5 = "CS5");
    SET(dsmonAggGroupStatus.2.6 = createAndGo(4),
        dsmonAggGroupDescr.2.6 = "CS6");
    SET(dsmonAggGroupStatus.2.7 = createAndGo(4),
        dsmonAggGroupDescr.2.7 = "CS7");
    SET(dsmonAggGroupStatus.2.8 = createAndGo(4),
        dsmonAggGroupDescr.2.8 = "EF");
    SET(dsmonAggGroupStatus.2.9 = createAndGo(4),
        dsmonAggGroupDescr.2.9 = "AF11");
    SET(dsmonAggGroupStatus.2.10 = createAndGo(4),
        dsmonAggGroupDescr.2.10 = "AF12");
    SET(dsmonAggGroupStatus.2.11 = createAndGo(4),
        dsmonAggGroupDescr.2.11 = "AF13");
    SET(dsmonAggGroupStatus.2.12 = createAndGo(4),
        dsmonAggGroupDescr.2.12 = "AF21");
    SET(dsmonAggGroupStatus.2.13 = createAndGo(4),
        dsmonAggGroupDescr.2.13 = "AF22");
    SET(dsmonAggGroupStatus.2.14 = createAndGo(4),
        dsmonAggGroupDescr.2.14 = "AF23");
    SET(dsmonAggGroupStatus.2.15 = createAndGo(4),
        dsmonAggGroupDescr.2.15 = "AF31");
    SET(dsmonAggGroupStatus.2.16 = createAndGo(4),
        dsmonAggGroupDescr.2.16 = "AF32");
    SET(dsmonAggGroupStatus.2.17 = createAndGo(4),
        dsmonAggGroupDescr.2.17 = "AF33");
    SET(dsmonAggGroupStatus.2.18 = createAndGo(4),
        dsmonAggGroupDescr.2.18 = "AF41");
    SET(dsmonAggGroupStatus.2.19 = createAndGo(4),
        dsmonAggGroupDescr.2.19 = "AF42");
    SET(dsmonAggGroupStatus.2.20 = createAndGo(4),
        dsmonAggGroupDescr.2.20 = "AF43");
    SET(dsmonAggGroupStatus.2.21 = createAndGo(4),
        dsmonAggGroupDescr.2.21 = "Nonzero Default");
```

   Example 3: an aggregated representation of current DIFFSERV PHBs.
   One group is created for each counter aggregation to be monitored (8
   rows in this example).

```
    SET(dsmonAggGroupStatus.3.0 = createAndGo(4),
        dsmonAggGroupDescr.3.0 = "Zero CS");
    SET(dsmonAggGroupStatus.3.1 = createAndGo(4),
        dsmonAggGroupDescr.3.1 = "Nonzero CS");
    SET(dsmonAggGroupStatus.3.2 = createAndGo(4),
        dsmonAggGroupDescr.3.2 = "EF");
    SET(dsmonAggGroupStatus.3.3 = createAndGo(4),
        dsmonAggGroupDescr.3.3 = "AF1");
    SET(dsmonAggGroupStatus.3.4 = createAndGo(4),
        dsmonAggGroupDescr.3.4 = "AF2");
    SET(dsmonAggGroupStatus.3.5 = createAndGo(4),
        dsmonAggGroupDescr.3.5 = "AF3");
    SET(dsmonAggGroupStatus.3.6 = createAndGo(4),
        dsmonAggGroupDescr.3.6 = "AF4");
    SET(dsmonAggGroupStatus.3.7 = createAndGo(4),
        dsmonAggGroupDescr.3.7 = "Nonzero Default");
```

5.6. Step 6: Create the Counter Aggregation Profile Mappings

   After the dsmonAggControlEntries are activated, the associated read-
   write dsmonAggProfileEntries will be created. The management station
   must create 64 entries in the dsmonAggProfileTable for each counter
   aggregation profile configured in the dsmonAggControlTable.

   Example 1: Each DSCP in its own counter aggregation group

```
    SET(dsmonAggGroupIndex.1.0 = 0,
        dsmonAggGroupIndex.1.1 = 1,
        dsmonAggGroupIndex.1.2 = 2,
        dsmonAggGroupIndex.1.3 = 3,
        ...
        dsmonAggGroupIndex.1.63 = 63);
```

   Example 2: a collection of current DIFFSERV PHBs.

```
    SET(dsmonAggGroupIndex.2.0 = 0,          -- CS0
        dsmonAggGroupIndex.2.1 = 21,         -- Nonzero Default
        dsmonAggGroupIndex.2.2 = 21,
        dsmonAggGroupIndex.2.3 = 21,
        dsmonAggGroupIndex.2.4 = 21,
        dsmonAggGroupIndex.2.5 = 21,
        dsmonAggGroupIndex.2.6 = 21,
        dsmonAggGroupIndex.2.7 = 21,
        dsmonAggGroupIndex.2.8 = 1,          -- CS1
```

```
        dsmonAggGroupIndex.2.9 = 21,
        dsmonAggGroupIndex.2.10 = 9,          -- AF11
        dsmonAggGroupIndex.2.11 = 21,
        dsmonAggGroupIndex.2.12 = 10,         -- AF12
        dsmonAggGroupIndex.2.13 = 21,
        dsmonAggGroupIndex.2.14 = 11,         -- AF13
        dsmonAggGroupIndex.2.15 = 21,
        dsmonAggGroupIndex.2.16 = 2,          -- CS2
        dsmonAggGroupIndex.2.17 = 21,
        dsmonAggGroupIndex.2.18 = 12,         -- AF21
        dsmonAggGroupIndex.2.19 = 21,
        dsmonAggGroupIndex.2.20 = 13,         -- AF22
        dsmonAggGroupIndex.2.21 = 21,
        dsmonAggGroupIndex.2.22 = 14,         -- AF23
        dsmonAggGroupIndex.2.23 = 21,
        dsmonAggGroupIndex.2.24 = 3,          -- CS3
        dsmonAggGroupIndex.2.25 = 21,
        dsmonAggGroupIndex.2.26 = 15,         -- AF31
        dsmonAggGroupIndex.2.27 = 21,
        dsmonAggGroupIndex.2.28 = 16,         -- AF32
        dsmonAggGroupIndex.2.29 = 8,          -- EF
        dsmonAggGroupIndex.2.30 = 17,         -- AF33
        dsmonAggGroupIndex.2.31 = 21,
        dsmonAggGroupIndex.2.32 = 4,          -- CS4
        dsmonAggGroupIndex.2.33 = 21,
        dsmonAggGroupIndex.2.34 = 18,         -- AF41
        dsmonAggGroupIndex.2.35 = 21,
        dsmonAggGroupIndex.2.36 = 19,         -- AF42
        dsmonAggGroupIndex.2.37 = 21,
        dsmonAggGroupIndex.2.38 = 20,         -- AF43
        dsmonAggGroupIndex.2.39 = 21,
        dsmonAggGroupIndex.2.40 = 5,          -- CS5
        dsmonAggGroupIndex.2.41 = 21,
        dsmonAggGroupIndex.2.42 = 21,
        dsmonAggGroupIndex.2.43 = 21,
        dsmonAggGroupIndex.2.44 = 21,
        dsmonAggGroupIndex.2.45 = 21,

        dsmonAggGroupIndex.3.4 = 7,
        dsmonAggGroupIndex.3.5 = 7,
        dsmonAggGroupIndex.3.6 = 7,
        dsmonAggGroupIndex.3.7 = 7,
        dsmonAggGroupIndex.3.8 = 1,         -- Nonzero CS
        dsmonAggGroupIndex.3.9 = 7,
        dsmonAggGroupIndex.3.10 = 3,        -- AF1
        dsmonAggGroupIndex.3.11 = 7,
        dsmonAggGroupIndex.3.12 = 3,
        dsmonAggGroupIndex.3.13 = 7,
        dsmonAggGroupIndex.3.14 = 3,
        dsmonAggGroupIndex.3.15 = 7,
        dsmonAggGroupIndex.3.16 = 1,
        dsmonAggGroupIndex.3.17 = 7,
        dsmonAggGroupIndex.3.18 = 4,        -- AF2
        dsmonAggGroupIndex.3.19 = 7,
        dsmonAggGroupIndex.3.20 = 4,
        dsmonAggGroupIndex.3.21 = 7,
        dsmonAggGroupIndex.3.22 = 4,
        dsmonAggGroupIndex.3.23 = 7,
        dsmonAggGroupIndex.3.24 = 1,
        dsmonAggGroupIndex.3.25 = 7,
        dsmonAggGroupIndex.3.26 = 5,        -- AF3
        dsmonAggGroupIndex.3.27 = 7,
        dsmonAggGroupIndex.3.28 = 5,
        dsmonAggGroupIndex.3.29 = 2,        -- EF
        dsmonAggGroupIndex.3.30 = 5,
        dsmonAggGroupIndex.3.31 = 7,
        dsmonAggGroupIndex.3.32 = 1,
        dsmonAggGroupIndex.3.33 = 7,
        dsmonAggGroupIndex.3.34 = 6,        -- AF4
        dsmonAggGroupIndex.3.35 = 7,
        dsmonAggGroupIndex.3.36 = 6,
        dsmonAggGroupIndex.3.37 = 7,
```

```
           dsmonAggGroupIndex.3.38 = 6,
           dsmonAggGroupIndex.3.39 = 7,
           dsmonAggGroupIndex.3.40 = 1,
           dsmonAggGroupIndex.3.41 = 7,
           dsmonAggGroupIndex.3.42 = 7,
           dsmonAggGroupIndex.3.43 = 7,
           dsmonAggGroupIndex.3.44 = 7,
           dsmonAggGroupIndex.3.45 = 7,
           dsmonAggGroupIndex.3.46 = 7,
           dsmonAggGroupIndex.3.47 = 7,
           dsmonAggGroupIndex.3.48 = 1,
           dsmonAggGroupIndex.3.49 = 7,
           dsmonAggGroupIndex.3.50 = 7,
           dsmonAggGroupIndex.3.51 = 7,
           dsmonAggGroupIndex.3.52 = 7,
           dsmonAggGroupIndex.3.53 = 7,
           dsmonAggGroupIndex.3.54 = 7,
           dsmonAggGroupIndex.3.55 = 7,
           dsmonAggGroupIndex.3.56 = 1,
           dsmonAggGroupIndex.3.57 = 7,
           dsmonAggGroupIndex.3.58 = 7,
           dsmonAggGroupIndex.3.59 = 7,
           dsmonAggGroupIndex.3.60 = 7,
           dsmonAggGroupIndex.3.61 = 7,
           dsmonAggGroupIndex.3.62 = 7,
           dsmonAggGroupIndex.3.63 = 7);
```

5.7. Step 7: Lock the Counter Aggregation Configuration

   Before any existing collections can be activated by the agent, the
   counter aggregation configuration must be locked, by setting the
   dsmonAggControlLocked scalar to 'true'.

```
      SET(dsmonAggControlLocked.0 = true(1));
```

6. Intellectual Property

   The IETF takes no position regarding the validity or scope of any
   intellectual property or other rights that might be claimed to
   pertain to the implementation or use of the technology described in
   this document or the extent to which any license under such rights
   might or might not be available; neither does it represent that it
   has made any effort to identify any such rights. Information on the
   IETF's procedures with respect to rights in standards-track and
   standards-related documentation can be found in BCP 11, RFC 2028.
   Copies of claims of rights made available for publication and any
   assurances of licenses to be made available, or the result of an
   attempt made to obtain a general license or permission for the use of

   such proprietary rights by implementors or users of this
   specification can be obtained from the IETF Secretariat.

   The IETF invites any interested party to bring to its attention any
   copyrights, patents or patent applications, or other proprietary
   rights which may cover technology that may be required to practice
   this standard. Please address the information to the IETF Executive
   Director.

             Base for High Capacity Networks", RFC 3273, May 2002.

9. Security Considerations

   In order to implement this MIB, a probe must capture all packets on
   the locally-attached network, including packets between third
   parties. These packets are analyzed to collect network addresses,
   protocol usage information, and conversation statistics. Data of
   this nature may be considered sensitive in some environments. In
   such environments the administrator may wish to restrict SNMP access
   to the probe.

   There are a number of management objects defined in this MIB that
   have a MAX-ACCESS clause of read-write and/or read-create. Such
   objects may be considered sensitive or vulnerable in some network
   environments. The support for SET operations in a non-secure
   environment without proper protection can have a negative effect on
   network operations.

   SNMPv1 by itself is not a secure environment. Even if the network
   itself is secure (for example by using IPSec), even then, there is no
   control as to who on the secure network is allowed to access and
   GET/SET (read/change/create/delete) the objects in this MIB.

   It is recommended that the implementors consider the security
   features as provided by the SNMPv3 framework. Specifically, the use
   of the User-based Security Model RFC 2574 [RFC2574] and the View-
   based Access Control Model RFC 2575 [RFC2575] is recommended.

   It is then a customer/user responsibility to ensure that the SNMP
   entity giving access to an instance of this MIB, is properly
   configured to give access to the objects only to those principals
   (users) that have legitimate rights to indeed GET or SET
   (change/create/delete) them.
