       Additional New ASN.1 Modules for the Cryptographic Message Syntax (CMS)
              and the Public Key Infrastructure Using X.509 (PKIX)

Abstract

   The Cryptographic Message Syntax (CMS) format, and many associated
   formats, are expressed using ASN.1. The current ASN.1 modules
   conform to the 1988 version of ASN.1. This document updates some
   auxiliary ASN.1 modules to conform to the 2008 version of ASN.1; the
   1988 ASN.1 modules remain the normative version. There are no bits-
   on-the-wire changes to any of the formats; this is simply a change to
   the syntax.

Status of This Memo

   This document is not an Internet Standards Track specification; it is
   published for informational purposes.

   This document is a product of the Internet Engineering Task Force
   (IETF). It represents the consensus of the IETF community. It has
   received public review and has been approved for publication by the
   Internet Engineering Steering Group (IESG). Not all documents
   approved by the IESG are a candidate for any level of Internet
   Standard; see Section 2 of RFC 5741.

   Information about the current status of this document, any errata,
   and how to provide feedback on it may be obtained at
   http://www.rfc-editor.org/info/rfc6268.

include Simplified BSD License text as described in Section 4.e of
the Trust Legal Provisions and are provided without warranty as
described in the Simplified BSD License.

This document may contain material from IETF Documents or IETF
Contributions published or made publicly available before November
10, 2008. The person(s) controlling the copyright in some of this
material may not have granted the IETF Trust the right to allow
modifications of such material outside the IETF Standards Process.
Without obtaining an adequate license from the person(s) controlling
the copyright in such materials, this document may not be modified
outside the IETF Standards Process, and derivative works of it may
not be created outside the IETF Standards Process, except to format
it for publication as an RFC or to translate it into languages other
than English.

Table of Contents

1. Introduction

   Some developers would like the IETF to use the latest version of
   ASN.1 in its standards. Most of the RFCs that relate to security
   protocols still use ASN.1 from the 1988 standard, which has been
   deprecated. This is particularly true for the standards that relate
   to PKIX, CMS, and Secure/Multipurpose Internet Mail Extensions
   (S/MIME).

   In this document we have either changed the syntax to use the 2008
   ASN.1 standard, or done some updates from previous conversions. The
   ASN.1 modules updated came from the following RFCs:

   o RFC 3274, Compressed Data Content Type for Cryptographic Message
      Syntax (CMS) [RFC3274].

   o RFC 3779, X.509 Extensions for IP Addresses and AS Identifiers
      [RFC3779].

   o RFC 6019, BinaryTime: An Alternate Format for Representing Date
      and Time in ASN.1 [RFC6019].

   o RFC 4073, Protecting Multiple Contents with the Cryptographic
      Message Syntax (CMS) [RFC4073].

   o RFC 4231, Identifiers and Test Vectors for HMAC-SHA-224,
      HMAC-SHA-256, HMAC-SHA-384, and HMAC-SHA-512 [RFC4231].

   o RFC 4334, Certificate Extensions and Attributes Supporting
      Authentication in Point-to-Point Protocol (PPP) and Wireless Local
      Area Networks (WLAN) [RFC4334].

   o RFC 5083, Cryptographic Message Syntax (CMS) Authenticated-
      Enveloped-Data Content Type [RFC5083].

   o RFC 5652, Cryptographic Message Syntax (CMS) [RFC5652].

   o RFC 5752, Multiple Signatures in Cryptographic Message Syntax
      (CMS) [RFC5752].

   Note that some of the modules in this document get some of their
   definitions from places different than the modules in the original
   RFCs. The idea is that these modules, when combined with the modules
   in [RFC5911] and [RFC5912], can stand on their own and do not need to
   import definitions from anywhere else.

This document does not explicitly update the RFCs from which the
ASN.1 modules have been extracted. This is because the original 1988
ASN.1 syntax remains the normative version and the modules in this
document as well as in [RFC5911] and [RFC5912] are informative (but
hopefully useful) annexes.

1.1. ASN.1 Updates (2002 to 2008)

The modules defined in this document are compatible with the most
current ASN.1 specification published in 2008 (see [ASN1-2008]). The
changes between the 2002 specification and the 2008 specification
include the creation of additional pre-defined types (DATE, DATE-
TIME, DURATION, NOT-A-NUMBER, OID-IRI, RELATIVE-OID-IRI, TIME, TIME-
OF-DAY) and the ability to define different encoding rules (ENCODING-
CONTROL, INSTRUCTIONS). None of the newly defined tokens are
currently used in any of the ASN.1 specifications published here.

Information on the changes to ASN.1 between the 1988 and 2002
versions can be found in [RFC6025].

1.2. Requirements Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
"SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this
document are to be interpreted as described in [RFC2119].

2. ASN.1 Module RFC 3274

   We have updated the ASN.1 module associated with this document to be
   2008 compliant and to use the set of classes previously defined in
   [RFC5911].

        smime(16) ct(1) 20 }

      ContentWithAttributes ::= SEQUENCE {
         content  ContentInfo,
         attrs    SEQUENCE SIZE (1..MAX) OF AttributeSet
                                           {{ ContentAttributeSet }}
      }

       ContentAttributeSet ATTRIBUTE ::= { ... }
    END
```

6. ASN.1 Module RFC 4231

   RFC 4231 does not contain an ASN.1 module to be updated. We have
   therefore created an ASN.1 module to represent the ASN.1 that is
   present in the document. Note that the parameters are defined as
   expecting a parameter for the algorithm identifiers in this module;
   this is different from most of the algorithms used in PKIX and
   S/MIME. There is no concept of being able to truncate the MAC
   (Message Authentication Code) value in the ASN.1 unlike the XML
   definitions. This is reflected by not having a minimum MAC length
   defined in the ASN.1.

```
HMAC-2010  { iso(1) identified-organization(3) dod(6) internet(1)

   END
```

8. ASN.1 Module RFC 5083

   This module is updated from RFC 5911 [RFC5911] by the following
   changes:

   1. Define separate attribute sets for the unprotected attributes
       used in EnvelopedData, EncryptedData, and
       AuthenticatedEnvelopedData (RFC 5083).

   2. Define a parameterized type EncryptedContentInfoType so that the
       basic type can be used with different algorithm sets (used for
       EnvelopedData, EncryptedData, and AuthenticatedEnvelopedData (RFC

      5083)). The parameterized type is assigned to an unparameterized
      type of EncryptedContentInfo to minimize the output changes from
      previous versions.

   Protocol designers can make use of the '08 ASN.1 constraints to
   define different sets of attributes for EncryptedData and
   EnvelopedData and for AuthenticatedData and AuthEnvelopedData.
   Previously, attributes could only be constrained based on whether
   they were in the clear or unauthenticated not on the encapsulating
   content type.

9. ASN.1 Module RFC 5652

   This module is updated from RFC 5911 [RFC5911] by the following
   changes:

   1. Define separate attribute sets for the unprotected attributes
       used in EnvelopedData, EncryptedData, and
       AuthenticatedEnvelopedData (RFC 5083).

   2. Define a parameterized type EncryptedContentInfoType so that the
       basic type can be used with algorithm sets (used for
       EnvelopedData, EncryptedData, and AuthenticatedEnvelopedData (RFC
       5083)). The parameterized type is assigned to an unparameterized
       type of EncryptedContentInfo to minimize the output changes from
       previous versions.

   We are anticipating the definition of attributes that are going to be
   restricted to the use of only EnvelopedData. We are therefore
   separating the different attribute sets so that protocol designers
   that need to do this will be able to define attributes that are used
   for EnvelopedData, but not for EncryptedData. The same separation is
   also being applied to AuthenticatedData and AuthEnvelopedData.

          iso(1) member-body(2) us(840) rsadsi(113549) pkcs(1) pkcs9(9)
          id-aa(2) 51 }

        MultipleSignatures ::= SEQUENCE {
          bodyHashAlg      DigestAlgorithmIdentifier,
          signAlg          SignatureAlgorithmIdentifier,
          signAttrsHash    SignAttrsHash,
          cert             ESSCertIDv2 OPTIONAL
        }

        SignAttrsHash ::= SEQUENCE {
          algID            DigestAlgorithmIdentifier,
          hash             OCTET STRING
        }

    END
```

11. Module Identifiers in ASN.1

   One potential issue that can occur when updating modules is the fact
   that a large number of modules may need to be updated if they import
   from a newly updated module. This section addresses one method that
   can be used to deal with this problem, but the modules in this
   document don't currently implement the solution discussed here.

When looking at an import statement, there are three portions: The
list of items imported, a textual name for the module, and an object
identifier for the module. Full implementations of ASN.1 do module
matching using first the object identifier, and if that is not
present, the textual name of the module. Note however that some
older implementations used the textual name of the module for the
purposes of matching. In a full implementation, the name assigned to
the module is scoped to the ASN.1 module that it appears in (and thus
the need to match the module it is importing from).

One can create a module that contains only the module number
assignments and import the module assignments from the new module.
This means that when a module is replaced, one can replace the
previous module, update the module number assignment module, and
recompile without having to modify any other modules.

A sample module assignment module would be:

```
ModuleNumbers
DEFINITIONS TAGS ::=
BEGIN
   id-mod-CMS ::= { iso(1) member-body(2) us(840) rsadsi(113549)
      pkcs(1) pkcs-9(9) smime(16) modules(0) 58 }

   id-mod-AlgInfo ::=
      {iso(1) identified-organization(3) dod(6) internet(1)
       security(5) mechanisms(5) pkix(7) id-mod(0)
       id-mod-algorithmInformation-02(58)}
END
```

This would be used in the following import statement:

```
IMPORTS
  id-mod-CMS, id-mod-AlgInfo
  FROM ModuleNumbers  -- Note it will match on the name since no
                      -- OID is provided

  CMSVersion, EncapsulatedContentInfo, CONTENT-TYPE
  FROM CryptographicMessageSyntax-2010
    id-mod-CMS

  AlgorithmIdentifier{}, SMIME-CAPS, ParamOptions
  FROM AlgorithmInformation-2009 id-mod-AlgInfo
  ;
```

12. Security Considerations

   This document itself does not have any security considerations. The
   ASN.1 modules keep the same bits-on-the-wire as the modules that they
   replace.
